PT Detecting hepatic cell proliferative disorder useful for detecting
PT hepatocellular carcinoma comprises detecting a methylated CpG-containing
PT glutathione-S-transferase nucleic acid.
XX
PS Claim 83; Page 42; 64pp; English.
XX
CC The present invention describes a method for detecting hepatic cell
CC proliferative disorders. The method comprises detecting a methylated CpG-
CC containing glutathione-S-transferase (GST) nucleic acid (I) in a hepatic
CC specimen or a biological fluid, where a methylated GST nucleic acid is
CC indicative of a hepatic cell proliferative disorder. The method can be
CC used to diagnose hepatocellular carcinoma, and to monitor progress of its
CC treatment. Increasing the level of GST is useful in the treatment of
CC liver cancer, in humans or animals. The method can detect the early
CC stages of tumourigenesis in liver cells simply. The present sequence
CC represents a PCR primer which is used in the amplification of the human
CC glutathione S-transferase pi gene (GSTP1) promoter in an example from the
CC present invention for mapping somatic GSTP1 CpG island DNA
CC hyperethylation changes by genomic sequencing after bisulfite treatment

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 2; Page 26; 62pp; English.
XX
CC   The present sequence is that of a perfectly matched target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Single mismatches can be detected.
CC   The invention relates generally to the use of metal surface quenchers
CC   such as particles or films for high sensitivity applications in, for
CC   example, detection and diagnostic systems

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine

PT   Determining a functional allele profile of a gene in a population by
PT   identifying the nucleotide sequence of a gene of genomic DNA from each of
PT   the individuals with a family history of functional alleles of the gene
PT   of interest.
XX
PS   Example 1; Page 9; 28pp; English.
XX
CC   The present invention relates to a method for determining a functional
CC   allele profile of a gene in a population. The method comprises
CC   identifying the nucleotide sequence of a gene of interest out of genomic
CC   DNA from each of a population of individuals identified as having a
CC   family history which indicates inheritance of functional alleles of the
CC   gene of interest, and rank ordering the frequency of occurrence of each
CC   haplotype, where the identity of the alleles containing each haplotype
CC   and the determination of their relative frequencies constitutes the
CC   functional allele profile of the gene of interest in the population. The
CC   method is useful for determining functional allele profiles which are
CC   useful in the treatment and diagnosis of diseases, for genetic and
CC   pharmacogenetic applications, and for evaluating the degree to which the
CC   gene(s) are under selective pressure. The present sequence represents a
CC   PCR primer used in the method of the invention.

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 62; 62pp; English.
XX
CC   The present sequence is that of a perfectly matched target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Single mismatches can be detected.
CC   The invention relates generally to the use of metal surface quenchers
CC   such as particles or films for high sensitivity applications in, for
CC   example, detection and diagnostic systems

XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   sequencing primer used to sequence the polymorphic genes of the invention

CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a PCR
CC   primer used to amplify the sequences of the invention

CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 70; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 539; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 264; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Example 1; Page 22; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
```

CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 11555; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT Identifying Frizzled-4 (FZD4) gene modulators for treating e.g. familial
PT exudative vitreoretinopathy or Coat's disease, comprises contacting a
PT compound with an FZD4 polypeptide or with a cell expressing FZD4
PT polypeptide.
XX
PS Disclosure; Page 103; 116pp; English.
XX
CC The invention relates to a novel method for identifying a Frizzled-4
CC (FZD4) modulating agent. The method comprises contacting a compound with
CC an FZD4 polypeptide or with a cell expressing an FZD4 polypeptide, and
CC determining the difference in the biological activity or expression of
CC the FZD4 polypeptide compared with when the compound is not present. The
CC immunodulatory compounds of the invention can have the follwing
CC activities of ophthalmological, vasotropic, antiinflammatory, vulnerary,
CC osteopathic, antimicrobial, antipsoriatic, and antidiabetic. The method
CC is useful for identifying modulators of FZD4, and such modulators are
CC useful in treating diseases related to Fzd-4 expression or activity. The

CC modulators are particularly useful in treating e.g. familial exudative
CC vitreoretinopathy, retinopathy of prematurity, Coat's disease, Norrie
CC disease, retinal angiomatosis, ocular toxocariasis, retinoblastoma,
CC retinal dysplasia, neovascular inflammatory vitreoretinopathy or
CC retinitis pigmentosa. The modulators are also useful for treating other
CC diseases involving the physiological and pathological processes of
CC neovascularisation, such as indications that may require stimulation of
CC neovascularisation (e.g. myocardial ischaemia, coronary artery disease,
CC wound healing, or fracture and tendon repair), indications that may
CC require inhibition of neovascularisation (e.g. cancer tumour growth and
CC metastatis, ocular neovascularisation, bone and cartilage destruction,
CC inflammatory and infectious diseases), indications that require vascular
CC remodeling (e.g. psoriasis or pre-eclampsia), and indications that
CC require inhibition of neovascularisation (e.g. respiratory distress,
CC peritoneal sclerosis, or diabetes). This polynucleotide sequence
CC represents an oligo relating to the FzD4 gene of the invention.

XX
CC AAT28044-T28075 represent primers for human fibroblasts in enhanced
CC differential display (EDD), which is used in conjuncture with the method
CC of the invention. EDD is an mRNA preparation method. AAT28044-T28055
CC represent T-rich 3'-primers, while AAT28056-T28075 are randomly selected
CC 5'-primers used in EDD of human fibroblasts. The 3'-primers used are
CC complementary to the poly-A tail of the mRNA. In the method of the
CC invention, mRNA is isolated from a senescent cell, and a young quiescent
CC cell, and the mRNAs are amplified in separate reaction mixtures. The
CC amplified sequences are then separated by size or charge, and the
CC products are analysed to identify a gene from young quiescent cells and
CC dividing cells, that is present at a different level from senescent
CC cells. The method can be used for the rapid and efficient identification
CC and isolation of senescence-related genes and gene products, and to
CC detect and distinguish between senescent and non-senescent cells. It can
CC also be used to destroy cells expressing senescence specific (or related)
CC gene products, and to screen for compounds capable of altering gene
CC expression in senescent cells. The method can also be used to ameliorate
CC problems associated with the accumulation of senescent cells such as age-
CC related lipofuscin accumulation in the retina, and in the treatment of
CC AIDS. Also, the method can be used to distinguish young cells from
CC senescent cells in donor tissue, which is useful in removing senescent
CC melanocytes overexpressing melanin which cause hypopigmentation, or liver
CC spots

PT Identifying, isolating and regulating senescence-related genes - useful
PT to ameliorate problems associated with accumulation of senescent cells,
PT e.g. age-related lipofuscin accumulation in the retina and AIDS.
XX
PS Claim 6; Page 25; 135pp; English.
XX
CC AAT28044-T28075 represent primers for human fibroblasts in enhanced
CC differential display (EDD), which is used in conjuncture with the method
CC of the invention. EDD is an mRNA preparation method. AAT28044-T28055
CC represent T-rich 3'-primers, while AAT28056-T28075 are randomly selected
CC 5'-primers used in EDD of human fibroblasts. The 3'-primers used are
CC complementary to the poly-A tail of the mRNA. In the method of the
CC invention, mRNA is isolated from a senescent cell, and a young quiescent

CC cell, and the mRNAs are amplified in separate reaction mixtures. The
CC amplified sequences are then separated by size or charge, and the
CC products are analysed to identify a gene from young quiescent cells and
CC dividing cells, that is present at a different level from senescent
CC cells. The method can be used for the rapid and efficient identification
CC and isolation of senescence-related genes and gene products, and to
CC detect and distinguish between senescent and non-senescent cells. It can
CC also be used to destroy cells expressing senescence specific (or related)
CC gene products, and to screen for compounds capable of altering gene
CC expression in senescent cells. The method can also be used to ameliorate
CC problems associated with the accumulation of senescent cells such as age-
CC related lipofuscin accumulation in the retina, and in the treatment of
CC AIDS. Also, the method can be used to distinguish young cells from
CC senescent cells in donor tissue, which is useful in removing senescent
CC melanocytes overexpressing melanin which cause hypopigmentation, or liver

PT Detection of differentially expressed mRNA mols. - using two-step
PT polymerase chain reaction amplification method.
XX
PS Claim 9; Col 15; 15pp; English.
XX
CC An improved method of Differential Display, named Enhanced Differential
CC Display (EDD) has been designed as a technique for screening differences
CC in gene expression between various cell types or between different stages
CC of cell development. The technique is highly reproducible, leading to
CC precise typing of the expressed genes in any given cell. EDD analysis
CC permits the identification of novel genes involved in differentiation,
CC aging and disease, and enables direct comparisons of different cell types
CC and disease states. By using longer primers, and/or an alteration in the
CC annealing temperatures, the number of false positives can be reduced.
CC First, cDNA is prepared from total cellular RNA using 12 different 22-
CC base oligonucleotides (AAT58484-95) that are targeted to the poly A tail
CC of pol II mRNA transcripts. The last two bases of each primer varies so
CC as to anchor the primer to the 3' end of different sets of mRNAs. A
CC second set of 12 22-base oligo primers (AAT58472-83) is designed to
CC randomly select a subset of cDNAs from each of the twelve 3' primers. PCR
CC amplification of a subset of cDNAs is carried out in a two step process
CC using particular 5' and 3' primers. The amplified gene products can then
CC be directly sequenced or rapidly subcloned for DNA sequencing

CC   and disease states. By using longer primers, and/or an alteration in the
CC   annealing temperatures, the number of false positives can be reduced.
CC   First, cDNA is prepared from total cellular RNA using 12 different 22-
CC   base oligonucleotides (AAT58484-95) that are targeted to the poly A tail
CC   of pol II mRNA transcripts. The last two bases of each primer varies so
CC   as to anchor the primer to the 3' end of different sets of mRNAs. A
CC   second set of 12 22-base oligo primers (AAT58472-83) is designed to
CC   randomly select a subset of cDNAs from each of the twelve 3' primers. PCR
CC   amplification of a subset of cDNAs is carried out in a two step process
CC   using particular 5' and 3' primers. The amplified gene products can then
CC   be directly sequenced or rapidly subcloned for DNA sequencing

PT   Identification of differential mRNA expression - based on signal
```

PT intensities from separated cDNA restriction fragments.
XX
PS Example; Col 7; 15pp; English.
XX
CC This sequence represents a PCR primer used in the method of the
CC invention. The method is for the identification of differential mRNA
CC expression among two or more different sources, comprises: (a) obtaining
CC mRNA samples from two or more sources; (b) synthesising a set of double
CC stranded cDNA from each of the mRNA samples; (c) generating a set of cDNA
CC fragments for each sample by cleaving the sets of cDNA with at least one
CC restriction endonuclease; (d) separating cDNA fragments obtained through
CC step (c) by gel electrophoresis; (e) obtaining pictures of the separated
CC cDNA fragments; (f) comparing pictures of separated cDNA fragments, and
CC (g) identifying specific cDNA fragments exhibiting different signal
CC intensities in the pictures of separated cDNA fragments, where
CC differential signal intensity of the cDNA fragments is indicative of
CC differential expression of mRNA species among the sources. This primer
CC was specifically used to differentiate between mRNA differentially
CC expressed in mouse thymus and spleen. The method is useful in medicine
CC and molecular biology for analysis of gene expression and diagnosis and
CC identification of mechanisms of pathology at the genetic level

PT control migration of endothelial cells in injured blood vessels.
XX
PS Example 3; Page 38; 81pp; English.
XX
CC This oligo-dT primer was used in the synthesis of cDNA from total RNA
CC isolated from human umbilical vein endothelial cells (HUVEC) stimulated
CC with fibrin. It was also used as a 3' primer with a 5' primer (see
CC AAV03676) in the PCR amplification of the cDNA. The PCR product was
CC cloned into a TA vector and used to screen a HUVEC cDNA library. RT-PCR
CC analysis (see AAV03677-84) was performed to analyse expression of Jagged,
CC Notch 1, Notch 2 and glyceraldehyde 3-phosphate dehydrogenase in human
CC endothelial cell populations. The novel human Jagged gene (see AAV03684)
CC and protein (see AAW40827) can be used to control migration of
CC endothelial cells and in methods of modulating angiogenesis

XX
PS Disclosure; Page 70; 120pp; English.
XX
CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung

```

PT   New human GC6 gene, useful for identifying agents for treating diseases
PT   and/or conditions associated with cell senescence.
XX
PS   Disclosure; Page 12; 79pp; English.
XX
CC   The invention relates to methods for modulating and identifying cellular
CC   senescence. Recombinant expression vectors comprising a recombinant
CC   polynucleotide corresponding to a polynucleotide in a human GC6 gene, are
CC   useful for altering senescent gene expression. The vectors and host cells
CC   comprising the vectors are useful for identifying agents that prevent or
CC   modulate senescent gene expression. The polynucleotides are useful for
CC   producing the protein, pGC6 and nucleic acid derivatives. The proteins
CC   encoded are useful for raising antibodies specific for pGC6, which are
CC   useful for isolating pGC6, and for detecting cells comprising pGC6 in
CC   complex cell mixtures. The characterization of the polynucleotides enable
CC   the identification of therapeutic agents that identify and distinguish
CC   between young and senescent cells. This enables treatment of aging
CC   diseases induced or exacerbated by cellular senescence

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 539; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.

PT Identifying differentially expressed messenger RNAs, useful for analyzing
PT gene expression or identifying mechanisms of pathology, comprises
PT assessing amounts of separated complementary DNA fragments corresponding
PT to the mRNA.
XX
PS Example; Col 7; 15pp; English.
XX
CC The present sequence is a primer used for first strand synthesis of cDNA
CC molecules from RNA extracted from mouse thymus and spleen. This was
CC performed as part of novel method for identifying differentially
CC expressed mRNA. The method comprises synthesising sets of fragments of
CC cDNA from a set of mRNA sequences, assessing the amounts of cDNA
CC fragments corresponding to the mRNA species, and comparing the signal
CC intensity from the separated cDNA fragments. The method is useful for the
CC analysis of gene expression and the diagnosis and identification of
CC genetic mechanisms of pathology. Unlike RT-PCR using arbitrary primers,
CC many sequences are amplified in a single reaction. The method is more
CC reproducible than prior art, allowing for a reliable comparison to be
CC made with independently conducted experiments. The method also makes it
CC possible to eliminate the excess of information that is characteristic
CC for the method with arbitrary primers

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

PT   Novel recombinant human hepatocyte auxin, its preparation and clinical
PT   application.
XX
PS   Example 1; Page 2 (disclosure); 13pp; Chinese.
XX
CC   The present invention describes a differential indication PCR (polymerase
CC   chain reaction) technique which is used to obtain a new complete gene
CC   able to promote the repair of damaged liver cells and with substance
CC   total length of 0.7 kb by screening the cDNA library of human foetal
CC   liver. The induction expression of engineering bacteria, the separation
CC   and cracking of inclusion body and the process for restoring and
CC   decontaminating proteins are built up to obtain high purity recombinant
CC   human hepatocyte auxin. It can externally promote the reproduction of
CC   primary culture liver cells and liver cancer cells BEL-7402 and
CC   internally promote the synthesis of mouse liver cell DNA after CCL4 is
CC   damaged and the repair of liver cells. The method may be used to treat
CC   serious hepatitis, chronic hepatitis, liver fibrosis and cirrhosis. The
CC   present sequence represents a primer which is used in the exemplification
CC   of the present invention

PT   ubiquinone.
XX
```

PS Disclosure; SEQ ID NO 11554; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT Identifying differentially expressed mRNA, by separating cDNAs
PT synthesized from mRNA of various cells by electrophoresis, comparing the
PT separation pictures, identifying fragments with differential signal
PT intensities.
XX
PS Example; Fig 1; 13pp; English.
XX
CC This invention relates to a novel method for identifying differentially
CC expressed mRNA molecules. It comprises synthesising cDNA molecules from
CC sets of mRNA fragments derived from different cell types and separating
CC the resultant cDNAs by gel electrophoresis. By comparison of these
CC separation pictures it is possible to identify those cDNA fragments that
CC exhibit differential signal intensities between various cell types.
CC Furthermore, those cDNA molecules identified as being differentially
CC expressed can be amplified and cloned as required. For the formation of a
CC set of fragments, the cDNA is cleaved by restriction endonucleases, such
CC that the fragments specifically correspond to the 3' or 5' end regions of
CC the mRNA molecules. The method of this invention can be useful in
CC medicine for diagnostic purposes, molecular biology for the analysis of
CC gene expression, as well as in the identification of pathology mechanisms
CC at a genetic level. This oligonucleotide sequence is the T(13) bio-primer
CC used to synthesise the first cDNA chain from the total RNA preparation,
CC extracted from the cell type of interest, a method of the invention

PT monitoring drug responses at the gene expression level and locating genes
PT involved in a particular response, by comparisons between mono-length
PT cRNA libraries.
XX
PS Example 3; Page 48; 73pp; English.
XX
CC The present sequence represents a primer used for reverse transcription
CC of mRNA to produce cDNA. The cDNA is used for cDNA library production, in
CC the course of the invention. The specification describes a method of
CC determining differential display of gene expression, by comparison of
CC mono-length cRNA libraries. These libraries are probe hybridised to
CC accessible ordered arrays to determine differential hybridisation display
CC sites between mono-length segment libraries and to locate genes of
CC expression differential. The methods are useful for determining

```
CC   differential hybridisation display sites between mono-length segment
CC   libraries and to locate genes of expression differential. The methods are
CC   also useful in gene identification related to complex traits. The methods
CC   also permit monitoring drug responses at the gene expression level and
CC   locating genes involved in a particular response. The methods are also
CC   useful for pharmacogenomic research in evaluating how variability in
CC   genetic background influences positive or negative response to a drug

PT   Ligase chain reaction - includes using gap filling method, used for
PT   detecting target nucleic acid sequences in e.g. bacteria and viruses.
XX
PS   Claim 10; Page 30; 52pp; English.
XX
CC   The sequences given in AAQ35499-500 and AAQ36055-64 are ligase chain
CC   reaction (LCR) nucleic acids which were used to detect HIV-2. These
CC   primers are specific to positions within the gag region of the HIV-2
CC   genome. These primers are used in an improved "gap filling" LCR, in that
CC   only a single type or two types of dNTPs are required to fill double
CC   gaps, each being pref. 1-3 bases. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Recombinant chicory genome containing sunflower male sterility gene - and
PT   related mitochondria, cytoplasm and plant cells, useful in production of
PT   chicory hybrids.
XX
PS   Example 2; Page 8; 20pp; French.
XX
CC   The invention relates to the manufacture of cytoplasmic male sterile
CC   chicory plants (Cichorium intybus) by the introduction of the open
CC   reading frame (ORF) 522 from sunflower (Helianthus annuus) plant genome
CC   by protoplast fusion. The primers AAV30513-V30514 are used to amplify a
CC   347 bp fragment of the orf522 sequence for identifying positive
CC   recombinant plant cell lines. Male sterile chicory plants are used in
CC   hybrid breeding programs to avoid problems of self-pollination

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT vasoconstriction.
XX
PS Disclosure; Page 70; 120pp; English.
XX
CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

XX
PS Disclosure; Page 539; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

PT   Diagnosis and prognosis of diseases involving cytosine methylation of the
PT   glutathione-S-transferase gene, especially prostatic cancer.
XX
PS   Claim 46; Page 71; 111pp; English.
XX
CC   Sequences AAZ47417-Z47422 are used as probes to determine that any
CC   amplified PCR products of the invention are due to DNA in which all
CC   unmethylated cytosines are converted to uracils. The invention relates to
CC   a diagnostic or prognostic assay. The assay includes amplification of a
CC   target region of the glutathione-S-transferase (GST) Pi gene under
CC   conditions which result in amplification occurring only if at least one
CC   cytosine is methylated. The amplified sequence can then be subjected to
CC   analysis and abnormal cytosine methylation can then be detected. The
CC   target region of DNA is treated with a high concentration of bisulphite
CC   resulting in selective deamination of cytosine, converting it to uracil.
CC   Methylated cytosines are resistant to the chemical deamination, and
CC   therefore when PCR amplification is carried out on the target DNA,
CC   cytosines that were methylated in the original sample prior to bisulphite
CC   treatment will still be read as cytosine, while unmethylated cytosines
CC   will be read as thymine. PCR primers are designed to anneal to the target
CC   sequence after bisulphite treatment. The primers can be either selective
CC   or non-selective for methylated sites, non-selective primers avoid sites
CC   that may or may not be methylated. There is a strong correlation between
CC   the methylation of regulatory regions of genes and their lack of
CC   expression. Expression of the GST-Pi gene is lost in nearly all cases of
CC   prostate cancer. The method is used for the diagnosis of cancer,
CC   particularly of prostate, breast, cervix, or liver cancer

PT   Novel polynucleotide encoding a Rar1 polypeptide from barley, useful for
PT   producing transgenic plants with increased pathogen resistance e.g. to
PT   powdery mildew, and for identifying homologous sequences in other
PT   species.
XX
PS   Example 1; Page 99; 131pp; English.
XX
CC   This sequence represents a PCR primer used in yeast artificial chromosome
CC   (YAC) analysis of barley Rar1 nucleotide sequences. Rar1 is a protein
CC   involved in the Barley resistance signalling pathways, and plant pathogen
CC   defence response signalling pathway. Rar1 is required for the action of
CC   the R (resistance) gene Mla-12. The invention relates to barley Rar1
CC   sequences and to putative homologues of Rar1, OsRar1-h1 (from rice) and
CC   AtRar1-h1 (from arabidopsis thaliana). Rar1 has antipathogenic and
CC   antifungal properties, and functions via gene modification. The Rar1
CC   polynucleotides are useful in the production of transgenic plants in
CC   which a defence response is modulated, especially barley with improved
CC   resistance to pathogens e.g. powdery mildew. They can be used to produce
CC   probes and primers useful to identify or isolate the polynucleotides
CC   (e.g. in a plant or plant cell) by standard methods and to isolate Rar1
CC   homologues from other species, which in turn are useful to manipulate
CC   resistance to agronomically important diseases. The polypeptides and
CC   antibodies raised against them are useful to identify and isolate the
CC   polypeptides or homologous polypeptides e.g. in other species

PT Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 264; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,

PT Recombinant expression systems for expressing heterologous nucleic acids
PT and producing recombinant protein, comprises nonpathogenic protozoa such
PT as Tetrahymena resistant to paclitaxel.
XX
PS Example 2; Page 36; 83pp; English.
XX
CC Primers AAA53817-18 were used to amplify genomic DNA from T. thermophila
CC transformants to identify sequences integrated into the BTU1 locus.
CC Tetrahymena thermophila expresses two major beta-tubulin genes (BTU1 and
CC BTU2), which encode identical beta-tubulin proteins. Either of these two
CC genes (but not both at once) can be disrupted without a detectable change
CC in the cell phenotype. A K350L substitution in the BTU1 beta-tubulin
CC protein confers increased resistance to microtubule-depolymerizing drugs
CC and increased sensitivity to paclitaxel, a microtubule-stabilizing drug.
CC Cells carrying the Btu1-1K350M allele can be transformed to paclitaxel
CC resistance by gene replacement of Btu1-1K350M with a wild-type BTU1 gene
CC fragment, eliminating the need to incorporate a means for positive
CC selection. Where the host organism is not a T. thermophila mutant
CC containing the Btu1-1K350M allele, BTU1::neo1 construct, which
CC substitutes the coding region of the neo1 gene (conferring resistance to
CC parmomycin) for that of BTU1, can be used to generate BTU1 gene knockouts
CC and for positive selection. Heterologous nucleic acids (especially
CC encoding antigenic polypeptides) can be inserted into a BTU gene for
CC successful cell-surface expression that is maintained by way of negative
CC selection. Preferred expression vectors disrupt the Btu1-1K350M gene by
CC homologous recombination-mediated insertion of a heterologous nucleic
CC acid, thereby restoring resistance to paclitaxel in the resulting
CC transgenic host. Transgenic ciliated protozoa are useful as live vaccines
CC for stimulating an immune response in a vertebrate. The transgenic
CC protozoan host cells are also useful for producing polyclonal antibodies
CC (claimed). In particular, Tetrahymena expressing Ichthyophthiius
CC multifiliis immobilization-antigen (i-antigen) protein on their surface
CC are effective vehicles for vaccination of freshwater fish against
CC infection by I. multifiliis

CC   Polynucleotides AAC66206 - AAC66208 encode human galectin 11, 11alpha and
CC   11beta AAB35705 - AAB35707 respectively. Galectin 11 polynucleotide and
CC   protein sequences have immunosuppressive; thyromimetic; hepatotropic;
CC   antiinflammatory; vasotropic; dermatological; nephrotropic; antirheumatic
CC   ; antiarthritic; antiviral; anti-HIV; nootropic; neuroprotective;
CC   antiParkinsonian; ophthalmological; cytostatic; antianaemic; cardiant;
CC   cerebroprotective; antibacterial; and immunomodulatory activity. Galectin
CC   11 polypeptides can be used to treat cell growth disorders, particularly
CC   cancer, autoimmune diseases, inflammatory diseases, asthma, or allergic
CC   diseases, in a mammal. The proteins and polynucleotides can be
CC   administered to regulate cell growth or differentiation in mammals.
CC   Antibodies specific for galectin 11 can be used to detect galectin 11
CC   polypeptides in a samples, used in diagnosis techniques. Proteins,
CC   polynucleotides and antibodies, can be used to treat, e.g. Hashimoto's
CC   thyroiditis, biliary cirrhosis, Behcet's disease, Crohn's disease,
CC   polymyositis, systemic lupus erythematosus, glomerulonephritis,
CC   rheumatoid arthritis, viral infections, inflammation, graft versus host
CC   disease, graft rejection, acquired immunodeficiency syndrome, Alzheimer's
CC   disease, Parkinson's disease, amyotrophic lateral sclerosis, Retinitis
CC   pigmentosa, cerebellar degeneration, brain tumour, multiple sclerosis,
CC   Sjogren's syndrome, aplastic anaemia, ischaemia, myocardial infarction,
CC   stroke, reperfusion injury, liver injury, septic shock, cachexia, and
CC   anorexia. PCR primers AAC66211 - AAC66215 are used to amplify galectin 11
CC   encoding DNA. Oligonucleotides AAC66216 - AAC66224 are used in the
CC   identification and characterisation of the galectin 11 polynucleotides

PT   Determining methylation state of FMR1 gene promoter for diagnosing
PT   fragile X syndrome in males involves denaturing DNA sample, subjecting
PT   DNA to bisulfite modification, amplifying DNA and detecting products.
XX
PS   Example 2; Fig 1; 20pp; English.
XX
CC   The present invention describes a novel method of diagnosing Fragile X
CC   syndrome using a PCR-based method of methylation analysis. The FMR1 gene
CC   promoter, located at chromosome Xq27.3, is composed of a CGG
CC   trinucleotide repeat. The expansion of this repeat leads to a premutation
CC   and then a full mutation, the latter of which is likely to cause the
CC   methylation of a nearby CpG island, causing the Fragile X syndrome
CC   phenotype. This method is useful in the design of appropriate therapies
CC   and counselling for affected individuals and carriers

PT Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT sample comprising the complex with ligand that binds to a component of
PT the complex and separating complex by binding ligand with a binding
PT molecule.
XX
PS Example 6; Page 31; 49pp; English.
XX
CC The specification describes a method for partitioning endogenous cellular
CC mRNA-protein (mRNP) complexes. The method comprises contacting a
CC biological sample comprising mRNP complex with ligand that specifically
CC binds a component of mRNP complex, separating mRNP complex by binding the
CC ligand with a molecule specific for ligand, which is attached to the
CC solid support and then collecting the mRNP complex by removing the
CC complex from the support. The method is useful for in vivo partitioning
CC of cellular mRNA protein complexes in a biological sample. The method is
CC useful for determining the ribonomic profile of a cell which has numerous
CC uses including monitoring of tumour development, state of growth or state
CC of development, perturbations of a biological system such as disease,
CC drug or toxin treatment and the state of cell aging or death,
CC distinguishing ribonomic profiles among organisms, to discriminate
CC between transcriptional and post-transcriptional contributions to gene
CC expression and to track the movement of RNAs through RNP complexes,
CC including the interactions of combinations of proteins with RNAs in RNP
CC complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC untranslated region (UTR) of mRNA of various genes. The sequences contain
CC target sequences for RNA-binding proteins

PT New VMGLOM genes and polypeptides, useful in gene therapy or for
PT preventing, treating or alleviating disorders with vascular component,
PT e.g. varicosities, cardiopathies, cerebral disorders or cancer.
XX
PS Disclosure; Page 72; 157pp; English.
XX
CC The present invention relates to the isolation of novel human and mouse
CC VMGLOM polypeptides (long form and short form), and the nucleic acid
CC molecules encoding them. VMGLOMs (also referred to as glomulins) are a
CC subtype of venous malformations (VMs) called glomangiomas. In humans,
CC VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic
CC acids encoding for them are useful as a medicament or for incorporation
CC into a diagnostic kit. Such medicaments are useful for preventing,
CC treating or alleviating disorders with a vascular component, particularly
CC where alteration of vascular smooth muscle cell phenotype is needed, e.g.
CC varicosities, cardiopathies or cardiomyopathies, cerebral disorders and
CC cancer. The nucleic acids are also useful in gene therapy. The present
CC sequence for forward PCR primer is used to amplify exon 14 of the human
CC VMGLOM gene in the methods of the present invention

PT   Novel isolated polypeptide, designated NOVX, useful for treating or
PT   preventing cancer, diabetes, obesity, dyslipidemia, anorexia, and
PT   metabolic, neurodegenerative, immune and hematopoietic disorders.
XX
PS   Example 2; Page 274; 421pp; English.
XX
CC   The invention relates to an isolated polypeptide, designated NOVX,
CC   comprising a sequence fully defined in the specification. The isolated
CC   protein, its encoding polynucleotide or an antibody created from the
CC   protein is useful in the manufacture of a medicament for treating a
CC   syndrome associated with a human disease, preferably a NOVX-associated
CC   disorder, or for treating or preventing a NOVX-associated disorder in a
CC   subject, preferably human. The isolated protein, its encoding
CC   polynucleotide or an antibody created from the protein are also useful
CC   for treating or preventing metabolic disorders, diabetes, obesity,
CC   infectious disease, anorexia, neurodegenerative disorder, Alzheimer's
CC   disease, Parkinson's disorder, immune disorders, haematopoietic
CC   disorders, and various dyslipidaemias, metabolic disturbances associated
CC   with obesity, the metabolic syndrome X, wasting disorders associated with
CC   chronic diseases, and cancer. The isolated protein, its encoding
CC   polynucleotide or an antibody created from the protein are useful for
CC   treating or preventing neurological disorders such as epilepsy, stroke,
CC   mental disorders including mood, anxiety, schizophrenic disorders,
CC   disorders of vesicular transport such as cystic fibrosis, diabetes
CC   mellitus, goiter, gastrointestinal disorders including ulcerative
CC   colitis, other conditions associated with abnormal vesicle trafficking
CC   including AIDS, allergic reactions, multiple sclerosis and rheumatoid
CC   arthritis. A cell comprising the vector of the invention is useful for
CC   producing non-human transgenic animals. The polynucleotide of the
CC   invention can be used to treat disorders by gene therapy. This
CC   polynucleotide sequence represents a probe of a sequence relating to the
CC   NOVX proteins of the invention

CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

XX
CC   The present sequence is that of an oligonucleotide used in a method
CC   designed to rapidly array and normalize a complex cDNA library obtained
CC   from a target species. Clones are arrayed into multi-well plates. Each
CC   well contains 16 oligonucleotides with a 5' polylinker, a poly-T run
CC   capable of binding cDNAs by their poly-A tail and a unique 3' sequence,
CC   which allows an anchored oligonucleotide in each well to selectively
CC   hybridise only to those cDNA clones with a complementary 5' end. The
CC   unique 3' key sequences are designed to give a comprehensive level of
CC   degeneracy since they are diverse and numerous enough to ensure that
CC   every possible cDNA sequence can be bound by an individual, specific
CC   oligonucleotide in a single well. The cDNA library is heated to denature
CC   the clones into single stranded DNA, and an aliquot is added to every
CC   well. The anchored oligonucleotide serves as the 3' primer in PCR, and
CC   the common 5' region present in every cDNA clone serves as the 5' priming
CC   site. Denaturing and washing leave anchored cDNA in each well. The
CC   library is now arrayed and normalised. The method was used to identify
CC   and isolate clones encoding G-protein coupled receptors, especially
CC   odourant receptors, and active effectors involved in the olfactory
CC   pathway of invertebrates and vertebrates, e.g. odourant binding proteins,
CC   or other olfactory or neuronal proteins. The identified receptors and
CC   proteins are useful for identifying compounds that reduce a target
CC   animal's sensitivity to odours, for manufacturing compounds or devices
CC   that mask odours, or trapping invertebrates with odourants.
CC   Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC   with desirable effects on specific species, for the development of pest
CC   monitoring systems or non-toxic, species-specific pesticide alternatives,
CC   for controlling insect feeding and breeding behaviour, detecting the
CC   presence of small air-borne molecules, etc

PT   New modified Cry protein, useful as insecticide, comprises at least one
PT   additional pepsin cleavage site to reduce persistence in mammalian gut.
XX
PS   Example 3; Page 26; 134pp; French.
XX
CC   The present invention describes a modified Cry protein (I) that is
CC   sensitive to pepsin and comprises at least one additional pepsin cleavage
CC   site (PCS). Also described: (a) increasing pepsin sensitivity of Cry
CC   proteins by incorporating at least one extra PCS; (b) polynucleotides
CC   (II) that encode (I); (c) chimeric genes (CG) that contain a promoter,
CC   (II) and terminator; (d) expression or transformation vector (III) that
CC   contains CG; (e) host organism (IV) transformed with (III), also, where
CC   the organism is a plant, its parts and seeds; (f) production of (I) by
CC   growing (IV); and (g) mono- or polyclonal antibodies (Ab) directed
CC   against (I). (I) has insecticide activity. (I) can be used as
CC   insecticides, particularly where expressed in transgenic plants. (I) are
CC   sensitive to enzymes in the digestive tract of mammals, so do not persist
CC   in the tract (lack of persistence is required by regulatory authorities
CC   for use, in foods, of seeds containing Cry proteins). Extra PCS do not
CC   increase degradation in the digestive tract of insects, so have no effect
CC   on insecticidal activity. ABV93450 to ABV93909 and ABP67997 to ABP68308

CC The present invention relates to a new DNA containing a fully defined 568
CC base sequence given in the specification. The polynucleotides and
CC proteins of the invention are useful in diagnosis and screening of
CC preventives or remedies for atopic dermatitis. The invention can also be
CC used in treating asthma, psoriasis, pancreatitis, rheumatoid arthritis,
CC nephritis, arteriosclerosis, allergic diseases, viral diseases,
CC inflammatory colitis, bronchitis and skin diseases. The present nucleic
CC acid sequence represents a PCR primer used in the methods of the
CC invention

PT   Normalization of nucleic acid libraries.
XX
PS   Example 2; Page 35; 59pp; English.
XX
CC   The invention relates to a new method for normalisation of nucleic acid
CC   molecules that comprises using haptenylated nucleic acid molecules in
CC   subtractive hybridization to remove the more highly abundant molecules.
CC   Normalised libraries produced by the method make all of the nucleic acid
CC   molecules present in the library available for isolation and subsequent
CC   analysis for the study of normal function of individual genes and the
CC   genomes. Using the methods, normalised nucleic acid libraries having a
CC   maximum variation in abundance of the member NAMs no greater than 2- to
CC   10-fold may be produced. The methods provide normalised libraries which
CC   have significantly reduced background

PT   Isolation of fibre-specific cotton promoter sequences - using selected
PT   DNA probes to screen genomic DNA fragments, for production of cotton
PT   fibres with improved characteristics.
XX
PS   Example; Col 23; 46pp; English.
XX
CC   Cotton fibre cell-specific promoter sequences were isolated by
CC   differential screening of a cotton plant cDNA library. Of 4788 clones
CC   from a 10 day cell library screened with leaf cDNAs, 800 clones not
CC   present in the leaf were isolated. These were screened with cDNAs from
CC   ovule, root and flower mRNAs and resulted in 79 clones isolated. PCR
CC   analysis was then used to remove cross-hybridising clones. This resulted
CC   in the isolation of 18 cDNA clones specifically expressed in cotton fibre
CC   cells (AAT30242-4 and AAT30253-67). These cDNAs were then used to screen
CC   for homologous genomic sequences (AAT30245-53 and AAT30268) in order to
CC   obtain the corresp. promoter sequences. This primer was used to generate
CC   the first cDNA strand from mRNA isolated from the cotton fibre cells. The
CC   promoters isolated from the fibre cell-specific clones can be used to
CC   generate transgenic cotton plants and lines producing fibres having
CC   altered quantity and quality. (Updated on 25-MAR-2003 to correct PF
CC   field.)

PT Modifying nucleotide sequence, including recombination of genes in (non-
PT)human cell, comprises introducing DNA-modifying molecule into cell cycle
PT synchronized cell.
XX
PS Example 4; Page 49; 67pp; English.
XX
CC The specification describes a method for modifying a nucleotide sequence
CC in the genome of a cell. The method comprises providing a cell and a DNA-
CC modifying molecule, manipulating the cell to generate a synchronized cell
CC and contacting the synchronized cell with the DNA-modifying molecule
CC under conditions such that a modification in the nucleotide sequence is
CC produced. The method is useful for modifying nucleotide sequences in the
CC genome of a human or non-human cell including a fertilized egg cell from
CC an animal such as sheep, pig, rabbit, cattle and a mouse cell such as
CC blastomere, eight-cell embryo cell, blastocoele, midgestation embryo cell
CC and embryonic stem cell. The cell is preferably DNA repair-deficient. The
CC method is useful for introducing a modification into the genome of a cell
CC for determining the effect of the modification on the cell. The method
CC generates transgenic cells and animals useful as models for diseases, and
CC for screening therapeutic agents. The method also facilitates targeted
CC recombination for producing gene knockout organisms and/or replacement of
CC detective genes with non-defective genes. Further the method is useful
CC for determining the function of a gene of unknown function. AAI65861-62
CC represent triplex forming oligonucleotides, which were used in the method
CC of the invention to modify a fragment of the Hprt gene

PT   signaling pathways.
XX
PS   Example 1; Page 23; 76pp; English.
XX
CC   PCR primers AAZ46098-99 were used to amplify cDNA encoding murine HPRT,
CC   in the course of the invention. The specification describes a murine
CC   forkhead activin signal transducer (FAST) protein, designated FAST2. The
CC   protein is a winged-helix/forkhead domain protein. The protein is an
CC   inducer of the homeobox gene goosecoid (gsc) by transforming growth
CC   factor (TGF)-beta or activin signaling. FAST2 binds to a nucleotide
CC   sequence in the gsc promoter. The FAST2 protein is useful for modulating
CC   signal transduction in a TGF-beta or activin signaling pathway, which
CC   involves FAST2 as transcription factor, by modulating the formation of
CC   Smad2/Smad4/FAST2 or Smad3/Smad4/FAST2 complex. Inhibition of FAST2
CC   binding to its target DNA site inhibits FAST2 specific TGF-beta
CC   signaling, which is associated with wound healing inflammation, and
CC   tumour progression. Excessive signaling is associated with scarring,
CC   arthritis and fibrosis in numerous diseases, including fibrosis of the
CC   liver and kidney

PT Antisense oligonucleotides targeted to nucleic acids encoding human tumor
PT necrosis factor receptor-associated factor (TRAF), useful for treating
PT diseases associated with TRAF expression such as inflammatory diseases.
XX
PS Example 14; Page 46; 170pp; English.
XX
CC The present invention relates to antisense oligonucleotides (see AAA55496
CC -A55757) which are targeted to nucleic acids encoding a human tumour
CC necrosis factor receptor-associated factor (TRAF). The antisense
CC sequences comprise at least one modified internucleotide linkage, which
CC is a phosphorothioate linkage. The oligonucleotides also include at least
CC one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety.
CC Sequences AAA55490-A55495 represent nucleotide sequences encoding human
CC TRAF1-6. Included in the invention is a method for treating a human
CC having a disease associated with the expression of TRAF comprising
CC administering an antisense oligonucleotide. The reduction of jun kinase
CC activation in cells comprises contacting the cells with an antisense
CC oligonucleotide targeted to TRAF-6. A method for the reduction of E-
CC selectin expression in cells or tissues comprises contacting the cells or
CC tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6.
CC The antisense oligonucleotides have antiproliferative and anti-
CC inflammatory activity and are useful for treating disorders associated
CC with cell proliferation and inflammation. The antisense oligonucleotides
CC may also be used as a diagnostic probe for studying gene function

XX
CC Primers AAA51247-50 were used to amplify a mutant C-terminal domain
CC (CTDs) of casein kinase II (CK2) alpha. The mutant was mutated to replace
CC each phosphorylation site at residues Thr-344, Thr-360, Ser-362 and Ser-
CC 370 with aspartic acid. Primers AAA51247-48 were used to introduce the
CC first mutation. The remaining 3 mutations were introduced using primers
CC AAA51249-50. Constructs containing the alpha subunit CTDs were used as
CC bait in a yeast two hybrid system to identify proteins which interact
CC with CK2. Human casein kinase II interacting protein-1 (CKIP-1) was
CC identified, which possesses a pleckstrin homology (PH) domain as well as
CC proline rich motifs and a potential leucine zipper. The protein functions
CC as an anchoring or targeting protein that localizes some of the cellular
CC casein kinase II to the plasma membrane. CKIP-1 regulates the
CC transformation of cells by regulating the activity or subcellular
CC localization of casein kinase II. CKIP-1 and modulators of CKIP-1 may be
CC useful for treatment of various disorders including cancer, arthropathy,
CC bone resorption, inflammatory disease, degenerative disorders of the
CC central nervous system and wounds

PT   Asynchronous chain-extending polymerase chain reaction for producing lots
PT   of target DNA fragments, comprises a multiple repeated heat circulation
PT   process.
XX
PS   Disclosure; Page 3; 4pp; Chinese.
XX
CC   The present invention relates to a kind of two chains asynchronously-
CC   elongated DNA amplification technology in vitro, which is characterized
CC   by that firstly, a pair of specific primers is synthesized according to
CC   the target DNA sequence to be amplified, then a repetitive sequence
CC   complementary oligo-repetitive sequence of 3' target DNA chain whose tail
CC   end is modified and elongation vitality is lost, then the oligo-
CC   repetitive sequence, chain primer, heat-resisting DNA polymerase, dNTP
CC   substrate, template DNA, magnesium ion, polymerase chain reaction (PCR)
CC   buffer solution and ultra-pure water are mixed uniformly and made into a
CC   reaction system. The reaction system then undergoes the processes of high
CC   -temp., low-temp., medium-low temp., medium-temp, and repeated heat
CC   circulation treatment in the heat-circulating instrument to obtain
CC   million copies of specific target DNA fragments. The invention adopts a
CC   multiple repeated heat circulation process, so that it can produce lots
CC   of target DNA fragments. The present sequence was used in the
CC   exemplification of the invention

CC   The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
CC   AGT02013. This is one of a set of oligonucleotides (see ABA91527-30) used
CC   to assess the minimum number of ribonucleotides in DNA-RNA chimeric
CC   oligonucleotides required for RNase H cleavage. Each oligonucleotide of
CC   the set had a different number of ribonucleotides, 2 in the present case.
CC   The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
CC   (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
CC   minutes. The results showed that 4 ribonucleotides were the minimum
```

CC number for RNA cleavage. The invention provides probes for nucleic acid
CC hybridisation. The probes form a hairpin structure comprising a double-
CC stranded stem and a single-stranded loop, and are capable of both
CC intramolecular and intermolecular hybridisation. The double-stranded stem
CC may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
CC RNase H cleavage. When the probe hybridises with a target DNA, the RNA
CC strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and
CC can be removed. Arrays and methods for nucleic acid hybridisation using
CC the probes are provided

PT New short interfering nucleic acid, useful e.g. for treatment and
PT diagnosis of obesity or diabetes, downregulates expression of the
PT stearoyl-CoA desaturase gene.
XX
PS Example 3; SEQ ID NO 290; 139pp; English.
XX
CC The present invention describes a short interfering nucleic acid (siNA)
CC that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC by RNA interference. Also described: (1) modulating expression of SCD
CC genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC virucide activities. The siNAs can be used to modulate expression of SCD
CC genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC diabetes (types I and II); atherosclerosis; cancer and viral infections.

CC They can also be used for drug screening; diagnosis; target
CC identification and validation; genetic engineering; pharmacogenomics;
CC studying gene function and gene mapping (e.g. of single-nucleotide
CC polymorphisms). The present sequence represents an SCD siNA, which is
CC used in the exemplification of the present invention.

PT Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting
PT amplification products to 2-dimensional gel electrophoresis to produce a
PT characteristic spot pattern for a specific mutation in either the BRCA1
PT or the hMLH1 gene.
XX
PS Claim 6; Page 21; 57pp; English.
XX
CC The invention relates to detecting mutations in the BRCA1 and hMLH1 gene
CC comprising subjecting a set of amplification products to two-dimensional
CC DNA electrophoresis (TGDS) to produce a characteristic spot pattern for a
CC specific mutation in either the BRCA1 or the hMLH1 gene. Also included
CC are test kits for enabling BRCA1 or hMLH1 gene testing comprising short
CC PCR primers given in the specification, mixed in 20 mM of Tris-HCl, 50 mM
CC KCl, 25 micro M of dNTP, and 5 % formamide. The method is useful for
CC detecting mutations in the BRCA1 (breast and ovarian cancer
CC susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA
CC mismatch repair gene). The present sequence is a PCR primer specific to
CC hMLH1 used in the method of the invention

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 70; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   interleukin -1 beta gene beginning at nucleotide 7378 contg. a purine
CC   rich sequence concd. on one strand of the duplex. The oligomer, and
CC   others like it are useful in diagnosis and therapy of diseases
CC   characterised by specific DNA duplex targets, e.g. HPV; HER; HIV,
CC   hepatitis B, herpes, malignant tumours and inflammation. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. The oligomer contains
CC   an inverted polarity region formed from an o-xyloso dimer synthon. The
CC   linking gp. is o-xyloso (nucleotides have the 3' positions of xylose
CC   sugars linked via the o-xylene ring). Two nucleotides are coupled through
CC   a xylene residue to form the dimer synthon. This additional modifications
CC   may render the oligomer stable to nuclease activity. The oligomer is able
CC   to inhibit gene expression, as verified by in vitro systems. See also
CC   AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Purificn. of double stranded DNA by triple helix formation - comprises
PT   hybridising immobilised oligo-nucleotide to specific sequence in target
PT   DNA.
XX
PS   Claim 11; Page 22; 34pp; French.
XX
CC   Double-stranded (ds) DNA can be purified from complex mixtures of nucleic
CC   acids, proteins, endotoxins, nucleases, etc. by passing the mixture over
CC   a support to which an oligonucleotide is covalently attached; the
CC   oligonucleotide is able to form a triple helix by hybridisation with a
CC   specific sequence present in the dsDNA. The present sequence is a
CC   preferred oligonucleotide which can form a triple-helix with the
CC   homopurine target sequence in AAT32773. The target sequence may be
CC   present naturally, e.g. in a plasmid origin of replication, or can be
CC   introduced artificially. The method is particularly suited to
CC   purification of plasmid DNA

PT   Recombinant defective virus contg. heterologous gene under control of
PT   glucose inducible promoter - and infected mammalian cells, esp. for gene
PT   therapy of diabetes.
XX
PS   Claim 9; Page 22; 41pp; French.
XX
CC   A new defective recombinant virus contains at least one heterologous gene
CC   under control of an expression signal inducible by glucose or its
CC   analogues. Preferably, the expression signal is derived from the 183 bp
CC   region located 5' of the type L pyruvate kinase (L-PK) gene, especially
CC   containing at least the L4 element (i.e. the binding site for the major
CC   late transcription factor (MLFT)/USF). Preferably, the expression signal
CC   also contains the L3 element (i.e. the present sequence) which is a
CC   binding site for hepatocyte nuclear factor 4. Expression of the
CC   recombinant virus can be controlled by glucose levels, but insulin
CC   production can be stopped immediately by administering glucagon. This
CC   avoids the risk of hypoglycaemia caused by excessive insulin production.
CC   Mammalian cells infected by the virus can be implanted into liver,
CC   spleen, pancreas or intestine, to provide insulin secretion at
CC   predetermined sites. The virus is useful in gene therapy to treat and/or
CC   prevent diseases associated with hyperglycaemia, particularly diabetes,
CC   but more generally can be used to provide controlled expression of a wide
CC   variety of proteins

PT   Purification of double-stranded DNA to pharmaceutical purity - using
PT   ceramic hydroxy:apatite and affinity or ion-exchange chromatography,
PT   particularly for plasmids intended for gene therapy.
XX
PS   Disclosure; Page 6; 51pp; French.
XX
CC   This sequence represents an oligonucleotide used in a method of purifying
CC   double-stranded DNA to pharmaceutical purity, especially for use in gene
CC   or cellular therapy. The method comprises at least one stage of
CC   chromatography on a column of ceramic hydroxyapatite (HA), and another
CC   stage comprising an affinity chromatography purification, preferably with
CC   an immobilised oligonucleotide able to form a triple-helix structure.
CC   This sequence is an example of such a triple-helix forming oligomer. The
CC   oligonucleotide preferably binds to a sequence present in the plasmid to
CC   be purified, especially in a marker gene or the origin of replication

PT   New nucleic acid transfer vector comprising double-stranded DNA linked to
PT   oligonucleotide, used for gene therapy.
XX
PS   Example 1; Page 30; 72pp; French.
XX
CC   The invention relates to a method of delivering a therapeutic double
CC   stranded DNA to a target cell or tissue by administering the DNA in a
CC   transfer vector. The vector comprises the double-stranded DNA molecule
CC   and at least one oligonucleotide that is linked to a targeting system and
CC   can form a triplex with a specific sequence within target cell or tissue.
CC   This sequence represents an example of an oligonucleotide able to form a
CC   linkage with a trgeting system ewhere the targeting system is a maleimide
CC   peptide-nuclear localisation signal. The vector is used to deliver
CC   therapeutic DNA (including antisense sequences or ribozymes) for gene
CC   therapy, e.g. sequences that encode enzymes, blood factors, hormones,
CC   tumour suppressors, also antigenic peptides for use as vaccines or
CC   immunotherapeutic agents for control of microbial or viral infections, or
CC   cancer

CC   can form a triplex with a specific sequence within target cell or tissue.
CC   This sequence represents an example of a target sequence able to form a
CC   triple helix with the oligonucleotides. The vector is used to deliver
CC   therapeutic DNA (including antisense sequences or ribozymes) for gene
CC   therapy, e.g. sequences that encode enzymes, blood factors, hormones,
CC   tumour suppressors, also antigenic peptides for use as vaccines or
CC   immunotherapeutic agents for control of microbial or viral infections, or
CC   cancer

PT   Generation of antisense oligonucleotides - by specifically targeting a
PT   GGGA motif found in mRNA sequences.
XX
PS   Example 2; Page 37; 55pp; English.
XX
CC   Antisense oligonucleotides (ASO) for inhibiting a tumour necrosis factor-
CC   alpha (TNF-alpha) gene in an animal, preferably a human, comprise 12-50
CC   nucleotides, 90% of which are complementary to a region of mRNA
CC   containing a GGGA sequence motif. The ASO is used to inhibit expression
CC   of a gene in an animal and for treating the animal when afflicted with a
CC   disease or disorder characterised by the presence of an mRNA from a gene
CC   containing a GGGA motif. The ASO are specifically targeted to a GGGA
CC   sequence motif found in mRNA from a gene. A study of known ASO has shown
CC   that at least half of the most efficacious ASO's contain one or more TCCC
CC   motifs. This ASO comprises a TCCC motif followed by a cytosine residue
CC   and corresponds to a region of the human p53 open reading frame

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 63; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT   Novel linear isothermal nucleic acid amplification of polynucleotide
PT   sequences by using single RNA/DNA composite primer, which forms basis for
PT   amplification of target sequence and optionally a termination sequence.
XX
PS   Example 5; Page 74; 115pp; English.
XX
CC   The invention relates to a novel method for the linear isothermal
CC   amplification of a nucleotide sequence. The method of the invention
CC   involves the use of a composite primer comprising an RNA portion and a 3'
CC   DNA portion. The RNA-DNA composite primer, and optionally a nucelotide
CC   comprising a termination sequence, is hybridised to a template, and the
CC   composite primer is extended with DNA polymerase. The RNA portion of the
CC   composite primer is then cleaved with an enzyme which cleaves RNA from an
CC   RNA/DNA hybrid (e.g., RNAse H), thereby enabling another identical
CC   composite primer to hybridise to the template and undergo primer
CC   extension. This strand displacement method enables multiple copies of DNA
CC   complementary to the target sequence to be produced. Multiple RNA copies
CC   of the target sequence can subsequently be produced using RNA polymerase
CC   and a nucleotide comprising a propromoter and a region which hybridises
CC   to the displaced primer extension product. Transcription is allowed to
CC   occur, producing RNA complementary to the displaced primer extension
CC   product. Linear isothermal amplification is useful for sequencing a
CC   defined nucleic acid target sequence. It may be used for detecting a
CC   mutation in a target nucleotide by analysing the amplified products for
CC   single stranded conformation, where a difference in conformation as
CC   compared with a reference single stranded nucleotide indicates a mutation
CC   in the target nucleotide. The method is also useful for the qualitative
CC   detection of a nucleic acid sequence, for quantitation of the target
CC   nucleic acid sequence, for detection of the presence of defined sequence
CC   alterations, for genotyping, and for the detection of presence of various
CC   pathogens in a single biological sample. The amplified nucleic acid
CC   products are also useful for genotyping, and can be used for microarray
CC   preparation. As the method does not require thermocycling, it can be
CC   easily automated and adapted for high throughput amplification and/or
CC   analysis of nucleic acids. Sequencing based on the amplification methods
CC   are simplified by the ability to perform the reactions isothermally, and
CC   the isothermal reaction is faster than that afforded by thermal cycling.
CC   Various target sequences and polymorphic sites in a single genomic DNA
CC   sample can be amplified simultaneously in a single reaction mixture. The
CC   present sequence represents a composite DNA-RNA primer targetted to a
CC   region of the Escherichia coli J gene which was used in an
CC   exemplification of the invention. Note: The present sequence (designated
CC   SEQ ID NO:5 on page 74) is 2 nucleotides shorter than the SEQ ID NO:5
CC   (AAF76383) given in the sequence list (page 112)

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Example 1; Page 153; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing
CC   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC   scar. AAH57577 to AAH62099 represent sequences used in the
CC   exemplification of the present invention

PT   Purifying double-stranded (ds) DNA from a solution containing dsDNA and
PT   other components, comprises passing the solution through a support
PT   comprising a covalently coupled oligonucleotide able to form a triple
PT   helix with the dsDNA.
XX
PS   Disclosure; Page 5; 40pp; English.
XX
CC   This invention comprises a method of purifying double-stranded DNA from a
CC   solution containing the double-stranded DNA mixed with other components,
CC   comprising passing the solution through a support comprising a covalently
CC   coupled oligonucleotide capable of forming a triple helix with the double
CC   -stranded DNA by hybridisation with a specific sequence present in the
CC   double-stranded DNA. The method is useful for purifying double-stranded
CC   DNA contained in a solution and mixed with other components. The new
CC   method is a simple, rapid and effective method for DNA purification, and
CC   makes it possible to obtain especially high purities with high yields.
CC   The method enables DNA to be purified from complex mixtures comprising
CC   other nucleic acids, proteins, endotoxins, nucleases and the like. The
CC   supports may be readily recycled, and the DNAs obtained display improved
CC   properties to pharmaceutical safety. Further, the method entails only one
CC   step contrary to prior art. The present sequence represents an
CC   oligonucleotide sequence used to create a triple helix in the DNA
CC   purification method of the invention

PT Generating multiple copies of desired nucleic acid sequence by linear
PT isothermal amplification of a defined sequence followed by isothermal
PT exponential amplification of the obtained sequence to yield multiple
PT copies.
XX
PS Example 5; Page 86; 121pp; English.
XX
CC The present invention relates to a method for generating multiple copies
CC of desired nucleic acid sequence. The method involves employing two
CC transcription modules, where first module provides linear composite
CC primer based amplification resulting in RNA transcripts and second module
CC provides for further amplification of first module by creating an
CC intermediate product comprising a double stranded promoter region from
CC which transcription can occur. The method is useful for generating
CC multiple copies of a desired nucleic acid sequence. The method is also
CC useful for sequencing target polynucleotide, comprising amplifying the
CC target by the method in the presence of a mixture of rNTP and rNTP
CC analogues so that transcriptions terminated upon incorporation of an rNTP
CC analogue and analysing the amplification products to determine sequence.
CC It can be used for detecting a mutation in target by single stranded
CC conformation polymorphism. It is used for producing a microarray
CC comprising amplifying target polynucleotide by method, and immobilising
CC the amplification products on a substrate to fabricate a microarray
CC comprising the products. The method is used for characterising a desired
CC sequence comprising amplifying target polynucleotide by method and
CC analysing the labelled RNA products. It is also useful for determining
CC gene expression profile in a sample. The present sequence is a RNA/DNA
CC hybrid composite PCR primer used in the first transcription module of a
CC composite-primer based amplification method

PT New double stranded RNA oligonucleotide, useful for preparing a
PT composition for treating or preventing hepatitis C virus.
XX
PS Disclosure; Page 63; 173pp; English.
XX
CC The invention relates to a novel isolated double stranded RNA
CC oligonucleotide about 19 to about 25 ribonucleotides in length or its
CC equivalent. One strand of the oligonucleotide comprises the same
CC nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA
CC polynucleotide sequence required for hepatitis C virus infection,
CC replication or pathogenesis in vitro or in vivo in a host cell. The
CC oligonucleotide of the invention demonstrates virucide activity and may
CC be useful for preparing a composition or vaccine for treating or
CC preventing hepatitis C virus, as well as during gene therapy procedures.
CC The current sequence is that of the HCV coding region-derived conserved
CC RNA sequence of the invention.

XX
PT   New double stranded RNA oligonucleotide, useful for preparing a
PT   composition for treating or preventing hepatitis C virus.
XX
PS   Disclosure; Page 49; 173pp; English.
XX
CC   The invention relates to a novel isolated double stranded RNA
CC   oligonucleotide about 19 to about 25 ribonucleotides in length or its
CC   equivalent. One strand of the oligonucleotide comprises the same
CC   nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA
CC   polynucleotide sequence required for hepatitis C virus infection,
CC   replication or pathogenesis in vitro or in vivo in a host cell. The
CC   oligonucleotide of the invention demonstrates virucide activity and may
CC   be useful for preparing a composition or vaccine for treating or
CC   preventing hepatitis C virus, as well as during gene therapy procedures.
CC   The current sequence is that of the HCV coding region-derived conserved
CC   RNA sequence of the invention.

PT   New short interfering nucleic acid downregulates expression of the c-fos
PT   gene useful for treatment and diagnosis of diseases, e.g. cancer and
PT   inflammation.
XX
PS   Example 3; SEQ ID NO 95; 145pp; English.
XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of the human c-fos gene by RNA interference. The
CC   siNAs may or may not comprise ribonucleotides and may be double or single
CC   stranded. They further comprise sense and antisense regions, or
CC   alternatively are assembled from a sense oligonucleotide and an antisense
CC   oligonucleotide. Specifically, the siNAs include short interfering RNA
CC   (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA
CC   (shRNA). The siNAs can be unmodified or chemically modified, can contain
CC   deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC   vector or enzymatically synthesised. The invention also relates to kits
CC   for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC   of siNA; and vectors that express siNA. The siNAs are used to modulate
CC   expression of the c-fos gene in cells, tissue explants or organisms
CC   (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC   treatment of a variety of conditions. They may be used for treating
CC   central nervous system lesions and injuries (e.g., Alzheimer's disease,
CC   Parkinson's disease, Huntington's disease, epilepsy, dementia or
CC   amyotrophic lateral sclerosis); various cancers; other proliferative
CC   diseases (e.g., restenosis and polycystic kidney disease); inflammatory
CC   and/or allergic diseases; viral infections (including HIV infection);
CC   autoimmune diseases; and transplant rejection. The siNAs are also useful
CC   for drug screening, diagnosis, therapeutic target identification and
CC   validation, genetic engineering, pharmacogenomics, studying gene
CC   function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC   The present sequence represents the upper strand of a human c-fos-
CC   targeted double-stranded siNA, which is identical to the c-fos transcript
CC   target sequence.

PT   New oligo:nucleotide(s) self paired at one or both ends - have improved
PT   resistance to nuclease(s) and reduced toxicity, useful as anti:sense
PT   molecules for treating dermatological disorders, virus infections,
PT   cancer, etc.
XX
PS   Example 1; Fig 4a; 40pp; French.
XX
CC   New hooked or semi-hooked oligonucleotides (see AAQ68869-71, AAQ68873,
CC   AAQ68875, AAQ68877, AAQ68879 and AAQ68880) are useful as therapeutic
CC   antisense molecules for treating dermatological disorders (e.g. atopical
CC   dermatitis, psoriasis, melanoma, T cell lymphoma etc.) viral infections
CC   (e.g. herpes simplex, papilloma, hepatitis or HIV); or cancer (when
CC   directed against an oncogene), due to their ability to hybridise with
CC   target nucleic acid. They can be used ex vivo, e.g., to treat bone marrow
CC   grafts. They can also be used for diagnosis or in cosmetics e.g. to block
CC   mRNA coding proteins involved in the ageing process such as collagenase
CC   or elastase. This linear antisense oligonucleotide is used as a control
CC   to see whether the hooked and semi-hooked oligonucleotides exhibit a
CC   greater resistance to exonucleases than linear oligonucleotides. (Updated
CC   on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct
CC   PA field.)

PT New nucleic acid implicated e.g. in tumor suppression, useful for
PT diagnosis of tumors, viral infection and cellular degeneration and for
PT drug screening.
XX
PS Claim 1; Page 468; 623pp; French.
XX
CC The present invention relates to novel human nucleic acid sequences (I).
CC The present sequence is one such nucleic acid sequence. Expression of (I)
CC are implicated in tumour suppression or reversion and apoptosis and viral
CC resistance. (I) are useful as probes or primers for detecting,
CC identifying, measuring and/or amplifying nucleic acid sequences, as
CC antisense reagents and for recombinant production of polypeptides. (I),
CC polypeptides (II) encoded by (I), vector containing (I), cells containing
CC these vectors and antibodies (Ab) against (II) are all useful for
CC treatment/prevention of viral, tumour and cell degeneration diseases
CC (especially neurodegeneration, such as Alzheimer's disease and
CC schizophrenia). Analysing the expression of (I) is also useful for
CC diagnosis and/or prognosis of such diseases. Transgenic animals carrying
CC (I) are used for studying the aetiology of these diseases (also immune
CC and inflammatory diseases). Note: In the present specification, SEQ ID 1
CC to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
CC in the specification

XX
PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Claim 15; SEQ ID NO 910; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC   This oligomer contains an inverted polarity region formed from an o-
CC   xyloso dimer synthon. Residues 13 and 14 are linked via an o-xyloso group
CC   (i.e. nucleotides that have xylose sugar linked via the o-xylene ring).
CC   The sequence is designed to target the Human interleukin-1 beta gene
CC   beginning at nucleotide 7378 and will covalently cross-link to it via the
CC   N4N4-ethanocytosine group. See also AAQ20026-Q20030

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 70; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   interleukin -1 beta gene beginning at nucleotide 7378 contg. a purine
CC   rich sequence concd. on one strand of the duplex. The oligomer, and
CC   others like it are useful in diagnosis and therapy of diseases
CC   characterised by specific DNA duplex targets, e.g. HPV; HER; HIV,
CC   hepatitis B, herpes, malignant tumours and inflammation. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. The oligomer contains
CC   an inverted polarity region formed from an o-xyloso dimer synthon. The
CC   linking gp. is o-xyloso (nucleotides have the 3' positions of xylose
CC   sugars linked via the o-xylene ring). Two nucleotides are coupled through
CC   a xylene residue to form the dimer synthon. This additional modifications
CC   may render the oligomer stable to nuclease activity. The oligomer is able
CC   to inhibit gene expression, as verified by in vitro systems. See also
CC   AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   New oligo:nucleotide(s) self paired at one or both ends - have improved
PT   resistance to nuclease(s) and reduced toxicity, useful as anti:sense
PT   molecules for treating dermatological disorders, virus infections,
PT   cancer, etc.
XX
PS   Example 1; Fig 4a; 40pp; French.
XX
CC   The new hooked or semi-hooked oligonucleotides (see AAQ68869-71,
CC   AAQ68873, AAQ68875, AAQ68877, AAQ68879 and AAQ68880) are useful as
CC   therapeutic antisense molecules for treating dermatological disorders
CC   (e.g. atopical dermatitis, psoriasis, melanoma, T cell lymphoma etc.)
CC   viral infections (e.g. herpes simplex, papilloma, hepatitis or HIV); or
CC   cancer (when directed against an oncogene), due to their ability to
CC   hybridise with target nucleic acid. They can be used ex vivo, e.g., to
CC   treat bone marrow grafts. They can also be used for diagnosis or in
CC   cosmetics e.g. to block mRNA coding proteins involved in the ageing
CC   process such as collagenase or elastase. Compared with linear antisense
CC   molecules, the hooked or semi-hooked oligonucleotides are more resistant
CC   to exonucleases and less toxic because they are less likely to hybridise
CC   with partially complementary non-target sequences. (Updated on 25-MAR-
CC   2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PA field.)

PT   Characterising genomic DNA by amplifying selected internal repeat units -
PT   in telomere repeat array used for, e.g. disease diagnosis, determn. of
PT   family relationships, telomere mapping, etc.
XX
PS   Claim 18; Page 52; 68pp; English.
XX
CC   The present sequence is a PCR primer for a sequence proximal to the human
CC   Xp/Yp pseudoautosomal region (PAR1) telomere repeat array, produced using
CC   sequence information obtd. from 32 Caucasian and 21 African DNAs. The
CC   sequence was found to contain 20 substitution polymorphisms, and a 10 bp
CC   deletion/insertion polymorphism found only in African DNAs. Claimed type
CC   specific primers, which hybridise to loci contained in the sequence, can
CC   be used for the characterisation of a genomic DNA test sample by
CC   amplifying selected internal repeat units in a telomere repeat array.
CC   This characterisation is useful in the detection of inherited or acquired
CC   disease predisposition, abnormal cell division or growth diagnosis (e.g.
CC   cancer), individual and family relationship identification and telomere
CC   mapping of human chromosomes from DNA flanking sequences

PT Prodn. of nucleoside dimers with methylenedioxy linkage - by reacting 5'-
PT protected nucleoside 3'-methylthio:methyl ether and 3'-protected
PT nucleoside with bromine.
XX
PS Example 2; Col 27; 27pp; English.
XX
CC The invention relates to a method for linking a first nucleoside or
CC oligonucleotide to a second nucleoside or nucleotide through an OCH2O
CC linkage, starting with a 5'-protected nucleoside or nucleotide which is
CC derivatised in the 3' position with an OCH2SMe group. The method
CC comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-
CC protected nucleoside or nucleotide with bromine in the presence of 2,6-
CC diethylpyridine (DEP) and molecular sieves; and (b) treating the product
CC with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (THF). The
CC OCH2O-linked dimers can be used in the synthesis of oligonucleotide
CC analogues (containing thioformacetal linkages) e.g. useful as diagnostic
CC agents (see WO9106629)

PT Streptococcal heat shock proteins and corresponding DNA sequences - used
PT in the production of a vaccine to treating and preventing strain-specific
PT Streptococcal infection.
XX
PS Example 9; Page 75; 156pp; English.
XX
CC Primers AAT73395-6 were used to amplify a 782 bp fragment of the gene
CC encoding the heat shock protein 72 (HSP72) from S. pneumoniae (AAT73391).
CC The amplified region starts at base 332 downstream of the ATG initiation
CC codon of the S. pneumoniae HSP72 gene (AAT73388). This region was chosen
CC as it is well conserved between Gram +ve bacterial HSP70 genes
CC characterised so far. The product was used to screen S. pyogenes and S.
CC agalactiae DNA libraries to isolate the corresponding HSP70 genes from
CC these species (see AAT73389 and AAT73390). The HSP72 protein and its
CC fragments, or antibodies specific to HSP72, are used in pharmaceutical
CC compositions, pref. a vaccine, for treating or preventing infection by S.
CC pneumoniae or related bacteria in humans, e.g. S.pyogenes or S.

```
CC   The present sequence is a synthetic PCR primer which is used for mutant
CC   glpK gene analysis. This mutant, RJF10m was constructed by the electro-
CC   transformation of E.coli FM5 with the non-replicative integration plasmid
CC   pRN102-1. Such transformants are chloramphenicol-resistant and kanamycin-
CC   sensitive. These glycerol kinase mutants of E.coli FM5 are used for the
CC   production of glycerol from glucose

PT   New isolated mammalian retinal calcium channel gene, used to develop
PT   products for the diagnosis and treatment of incomplete congenital
PT   stationary night blindness and related disorders.
XX
PS   Example 4; Page 27; 55pp; English.
XX
CC   The invention provides a DNA molecule comprising a sequence of
CC   nucleotides encoding an alpha1F-subunit of a mammalian retinal calcium
CC   channel (RCC), including a human alpha1F-subunit, a murine alpha1F-
CC   subunit and orthologs of the human and murine alpha1F-subunits. The RCC
CC   gene may be used to develop products for diagnostic tests, for incomplete
CC   CSMB and risk assessment in affected families. The RCC gene can provide
CC   information as to the basic defect in this retinal conditions, which
CC   could lead to effective methods for treatment or cure of the disorder. As
CC   the associated features of myopia, nystagmus and strabismus frequently
CC   observed in patients with incomplete CSNB may be caused by calcium-
CC   regulated development pathways, identification of the RCC gene may help
CC   to elucidate the molecular details of eye development and which may lead
CC   to treatment for related eye disorders or diseases. Sequences AAZ46522-
CC   540 represent PCR primers used for the isolation of murine CACNA1F
CC   (alpha1F- subunit of RCC gene) ortholog

PT   Antisense oligonucleotides targeted to nucleic acids encoding human tumor
PT   necrosis factor receptor-associated factor (TRAF), useful for treating
PT   diseases associated with TRAF expression such as inflammatory diseases.
XX
PS   Example 33; Page 100; 170pp; English.
XX
CC   The present invention relates to antisense oligonucleotides (see AAA55496
CC   -A55757) which are targeted to nucleic acids encoding a human tumour
CC   necrosis factor receptor-associated factor (TRAF). The antisense
CC   sequences comprise at least one modified internucleotide linkage, which
CC   is a phosphorothioate linkage. The oligonucleotides also include at least
CC   one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety.
CC   Sequences AAA55490-A55495 represent nucleotide sequences encoding human
CC   TRAF1-6. Included in the invention is a method for treating a human
CC   having a disease associated with the expression of TRAF comprising
CC   administering an antisense oligonucleotide. The reduction of jun kinase
CC   activation in cells comprises contacting the cells with an antisense
CC   oligonucleotide targeted to TRAF-6. A method for the reduction of E-
CC   selectin expression in cells or tissues comprises contacting the cells or
CC   tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6.
CC   The antisense oligonucleotides have antiproliferative and anti-
CC   inflammatory activity and are useful for treating disorders associated
CC   with cell proliferation and inflammation. The antisense oligonucleotides
CC   may also be used as a diagnostic probe for studying gene function

PT   Nucleic acids encoding transmembrane protein TRPC7 expressed in brain and
PT   homologous to transient receptor potential protein useful in the of
PT   treatment of associated diseases such as periodic psychosis.
XX
PS   Example 7; Page 38; 77pp; Japanese.
XX
CC   The invention relates to the isolation of a nucleic acid (AAA11284)
CC   coding for a transmembrane protein TRPC7 (AAY92944) which is expressed in
CC   brain and is homologous to transient receptor potential (TRP) protein.
CC   This suggests that the TRPC7 protein may have a calcium channel function.
CC   The genomic sequence has been shown to contain 31 introns. This sequence
CC   represents an exon/intron junction from the genomic TRPC7 sequence. The
CC   DNA and protein can be used in the diagnosis and treatment of disorders
CC   associated with TRPC7, especially the screening, monitoring and treatment
CC   (by gene therapy) of periodic psychosis, which appears to be associated
CC   with mutations in the TRPC7 gene

PT   Novel high efficiency retroviral vectors lacking viral coding sequences
```

```
PT   useful for gene therapy.
XX
PS   Example 1; Page 57; 68pp; English.
XX
CC   PCR primers AAZ60521-22 were used to amplify a bacterial CAT gene. The
CC   amplified fragment was inserted into the murine leukemia virus (MLV)-
CC   based retroviral vectors of the invention, and used to test gene
CC   expression from the vectors. The specification describes MLV-based
CC   retroviral vectors in which the viral coding sequences (specifically gag,
CC   env and pol) are completely deleted. The vectors also contain a
CC   heterologous intron and/or a heterologous splicing acceptor which is
CC   inserted into the upstream position of a cloning site for a foreign gene.
CC   The retroviral vectors are used for gene therapy. The vectors also allow
CC   foreign genes to be expressed both stably and efficiently, in high
CC   amounts, and allow the cloning of larger sequences. In the vectors of the
CC   invention, the formation of replication-competent retrovirus through
CC   homologous recombination, due to the presence of viral coding sequences
CC   in the vector, is not possible, as all retroviral coding sequences are
CC   deleted

PT   Identification and detection of eukaryotes by probing an intron-
PT   containing region in a type II topisomerase gene.
XX
PS   Disclosure; Page 4; 30pp; English.
XX
CC   The present invention relates to the identification of a eukaryote based
CC   on the sequence of a type II topoisomerase gene intron containing region.
CC   The method comprises amplifying the eukaryote DNA by PCR or cDNA cloning,
CC   comprising a primer or probe having a nucleotide sequence encoding a
CC   specific polypeptide. The present sequence represents a nucleotide
CC   sequence encoding a polypeptide recognised by the primers used in the
CC   invention. Those peptides used to create primers for use in the method
CC   were selected by comparing the amino acid sequences of the type II
CC   topoisomerase of organisms belonging to the Animalia, Plantae, Protista
CC   and Fungi kingdoms. The regions containing conserved amino acid sequences
CC   for the respective eukaryotes were chosen, and included regions with the
CC   fewest possible degenerate codons. The method is based on the
CC   identification and detection of DNA sequences in introns. These non-
CC   coding regions are subject to a faster mutation rate than coding regions
CC   and are therefore less conserved, making them very useful in the
CC   identification of closely related organisms. The method is useful in the
CC   detection and identification of eukaryotes

PT   New nucleic acids other than naturally occurring chromosomes encoding
PT   ASTH1 protein, for e.g. screening compositions that modulate expression
PT   or function of ASTH1 proteins or as diagnostics for genetic
PT   predisposition to asthma.
XX
PS   Example; Col 41-42; 131pp; English.
XX
CC   The invention relates to the ASTH1 locus on the short arm of human
CC   chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which
CC   are associated with a genetic predisposition to asthma and bronchial
CC   hyperreactivity. The ASTH1I and ASTH1J genes are oriented in opposite
CC   directions with the ASTH1 locus, and have similar patterns of expression
CC   and common sequence motifs. They are both expressed in trachea, lung and
CC   several other tissues. ASTH1I and ASTH1J are novel members of the ets
CC   family of transcription factors, which have been implicated in the
```

```
CC   activation of a variety of genes including the TCRa gene and cytokine
CC   genes known to be important in the aetiology of asthma. Both ASTH1I and
CC   ASTH1J mRNAs are alternatively spliced. Alternative splicing of
CC   transcripts has no effect on the open reading frame of ASTH1J, as the
CC   exons involved are all 5' to the start codon in exon b. In contrast,
CC   alternative splicing of ASTH1I transcripts results in 3 different ASTH1I
CC   isoforms. The invention also encompasses mouse asth1j protein. The ASTH1
CC   nucleic acids are useful as diagnostics to identify a hereditary
CC   predisposition to asthma, as probes for identifying ASTH1 related genes,
CC   for identifying expression of the gene in a biological specimen, and for
CC   generating genetically modified non-human animals or site specific gene
CC   modifications in cell lines. The encoded ASTH1 proteins are useful as
CC   immunogens to raise specific antibodies; in drug screening for
CC   compositions that mimic or modulate activity or expression of ASTH1I
CC   and/or ASTH1J (including altered forms of these proteins); and as a
CC   therapeutic. The ASTH1 genes or fragments thereof, encoded proteins,
CC   ASTH1 genomic regulatory regions, and anti-ASTH1I and anti-ASTH1J
CC   antibodies are useful in the identification of individuals predisposed to
CC   development of asthma, and for modulation of gene activity in vivo for
CC   prophylactic and therapeutic purposes. The intact ASTH1I or ASTH1J
CC   proteins or active fragments thereof may be used to modulate or reduce
CC   bronchial hyperreactivity. Sequences AAA80260-A80261 and AAA80264-A80416
CC   represent polymorphic sites within the ASTH1J or ASTH1I genes

PT   Novel nucleic acid fragment encoding a non-specific catalytic activity
PT   for the bioconversion of 3-hydroxypropionaldehyde to 1,3-propanediol.
XX
PS   Example 2; Page 92; 109pp; English.
XX
CC   The present invention an isolated nucleic acid fragment (I) encoding a
CC   non-specific catalytic activity for the conversion of 3-
CC   hydroxypropionaldehyde to 1,3-propanediol. Also described are: (1) a
CC   polypeptide (II) encoded by (I); (2) a chimeric gene (III) comprising (I)
CC   operably linked to suitable regulatory sequences; (3) a microorganism
CC   (IV) transformed with (III), where (IV) is selected from Citrobacter,
CC   Enterobacter, Clostridium, Klebsiella, Aerobacter, Lactobacillus,
CC   Aspergillus, Saccharomyces, Schizosaccharomyces, Zygosaccharomyces,
CC   Pichia, Kluyveromyces, Candida, Hansenula, Debaromyces, Mucor,
CC   Torulopsis, Methylobacter, Salmonella, Bacillus, Streptomyces and
CC   Pseudomonas; (4) a recombinant microorganism (V), useful for the
CC   production of 1,3-propanediol; (5) a vector pDT29 (VI) comprising a set
CC   of genes dhaR, orfY, dhaT, orfX, orfW, dhaB1, dhaB2, dhaB3 and orfZ with
CC   a 12145 base pair sequence (AAF81961); and (6) a vector pKP32 (VII)
CC   comprising dhaR, orfY, orfX, orfW, dhaB1, dhaB2, dhaB3 and orfZ with a
CC   sequence (AAF81961). (V) e.g. Escherichia coli, is useful for the
CC   bioproduction of 1,3-propanediol by contacting (V) with a carbon source,
CC   and optionally recovering the 1,3-propanediol produced. A fermentable
CC   carbon source can be directly converted to 1,3-propanediol at
CC   significantly higher titre resulting in improved economics, and an
CC   improved process for the production of 1,3-propanediol from glucose. The
CC   present sequence represents a PCR primer used to amplify an Escherichia
CC   coli FM5 glpK mutant, which is used in an example from the present
CC   invention

```
PS   Claim 21; Page 1497; 1580pp; English.
XX
CC   The present invention describes a method for generating a repertory of
CC   nucleic acids of tuf, fus, atpD and/or recA genes from which probes
CC   and/or primers are derived. The method comprises amplifying the nucleic
CC   acids of determined algal, archaeal, bacterial, fungal and parasitical
CC   species with a combination of defined primer pairs. The method can be
CC   used for producing probes and/or primers for detecting one or more
CC   related microorganisms e.g. algae, archaea, bacteria, fungi and
CC   parasites, for universal detection and for specific and ubiquitous
CC   detection and identification of an algal, archaeal, bacterial, fungal and
CC   parasitical species, genus, family and group. A nucleic acid (I) obtained
CC   using the method of the invention can be used for the universal detection
CC   of any bacterium, fungus or parasite in a sample and for the detection of
CC   at least one antimicrobial agent resistance gene or at least one toxin
CC   gene. hexA nucleic acids are used for the specific and ubiquitous
CC   detection and for identification of Streptococcus pneumoniae. (I) can be
CC   used to design a therapeutic agent which is effective against
CC   microorganisms. Microbial species or genus or family or phylum or group
CC   which can be detected include Abiotrophia adiacens, Bordetella sp.,
CC   Corynebacterium sp., Enterobacteriaceae group, Escherichia coli,
CC   Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria
CC   gonorrhoeae and Staphylococcus sp. . Using DNA based tests provides faster
CC   results than substrate specificity tests as results can be determined in
CC   an hour and improved accuracy is also achieved. AAH00010 to AAH002304
CC   represent nucleotide sequences and primers/probes which are given in the

PT New antisense compound to inhibit caspase 3 is useful for treating
PT hepatitis and atherosclerosis.
XX
PS Example 15; Page 84; 127pp; English.
XX
CC The present sequence for human caspase 3 antisense oligonucleotide 108882
CC is 1 of various novel antisense oligonucleotides (AAS10517-AAS10676)
CC described in the present invention. Also described are methods of using
CC these compounds for the modulation of caspase 3 expression. The caspase 3
CC antisense oligonucleotides specifically hybridise with and inhibit the
CC expression of caspase 3. Antisense compounds targeted to caspase 3 are
CC useful to inhibit caspase 3 expression in cells or tissues and to
CC modulate apoptosis. The caspase 3 antisense oligonucleotides are useful
CC for treating disorders associated with expression of caspase 3. Such
CC disorders include hyperproliferative disorders (e.g. cancer), viral
CC infections (e.g. hepatitis), haematopoietic disorders, autoimmune
CC disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's
CC disease)

PT Human embryo-derived cell culture comprising cells that simultaneously
PT express polypeptide or mRNA markers that are characteristic of at least 2
PT cell types, useful in tissue transplantation, drug discovery, gene
PT therapy.
XX
PS Example 7; Page 75; 107pp; English.
XX
CC The specification describes a human embryo-derived (EBD) cell culture
CC that comprises cells which simultaneously express polypeptide or mRNA
CC markers that are characteristic of at least 2 different cell types. The
CC cell types are ectodermal, mesodermal, and/or endodermal cells. The
CC markers include nestin, vimentin, myf6, myosin light-chain 2 ventricular
CC isoform, flk1, alpha-1 fetoprotein and GATA-4. The EBD cells are useful
CC in cell culture, tissue transplantation, tissue engineering, drug
CC discovery and gene therapy. They are especially useful in transplantation
CC therapies for the treatment of Parkinson's disease, amyotrophic lateral
CC sclerosis, stroke, injury to motor neurons, including spinal cord injury,
CC and diabetes. Human EBD cells can be implanted into the central nervous
CC system for the treatment of disease or physical brain injury, such as
CC ischemia or chemical injury, as well as to treat diseases of cardiac,
CC skeletal or smooth muscles, liver, pancreas, eyes, vascular diseases, to
CC repopulate bone marrow, in organotypic co-culture, in the biosynthetic
CC production of macromolecules, and in the construction and testing of
CC human artificial chromosomes. AAH42612-85 represent PCR primers and
CC probes for markers of human cells. They were used to examine the mRNA
CC expression profiles of human cells

PT Differentiating embryonic stem cells from endocrine cells, for treating a
PT pancreatic endocrine disorder, e.g. type I or type II diabetes, comprises
PT culturing endocrine cells in an expansion medium containing a growth
PT factor.
XX
PS Example 1; Page 42; 76pp; English.
XX

```
CC   The invention provides a method of differentiating embryonic stem cells
CC   to endocrine cells. The method involves generating embryoid bodies from a
CC   culture of undifferentiated embryonic stem cells, selecting endocrine
CC   precursor cells (EPCs), expanding the EPCs by culturing in an expansion
CC   medium that comprises a growth factor, and differentiating the expanded
CC   EPCs in a differentiation medium. The present sequence is a forward PCR
CC   primer for alpha-amylase-2A. Use with the primer given in ABN84467
CC   generates a product of 300 bp. A primer set (see ABN84454-71) was used in
CC   an example of the invention for RT-PCR analysis of endocrine pancreatic
CC   gene expression in mouse embryos at stages 1 and 5. The results suggested
CC   that the culture conditions used to generate pancreatic endocrine cells
CC   supported the differentiation of pancreatic cells. Pancreatic endocrine
CC   cells generated in vitro can be used as a model system to study the cells
CC   of the islets of Langerhans, to study the kinetics and pharmacology of
CC   insulin release, to study agents that affect insulin secretion, and for
CC   the development of artificial islet and artificial pancreas tissues for
CC   use in the treatment of pancreatic endocrine disorders, particularly type
CC   I or type II diabetes

PT   New antisense oligonucleotides for modulating the expression of MP-1 (MAP
PT   kinase partner 1), for preventing, delaying or treating infection,
PT   inflammation or tumor formation, especially in humans.
XX
PS   Claim 1; Col 41-42; 47pp; English.
XX
CC   The invention relates to an antisense compound (ABA83459-ABA83576) which
CC   is up to 30 nucleobases in length and that inhibits the expression of MP-
CC   1 (MAP kinase Partner 1) in cells or tissues comprising contacting the
CC   cells or tissues in vitro with the antisense compound so that expression
CC   of MP-1 is inhibited. The antisense compounds have potential
CC   antiinflammatory, cytostatic and antimicrobial activity. The antisense
CC   compounds are useful for diagnostics, therapeutics, prophylaxis or as
CC   research reagents or kits. The antisense oligonucleotides are useful in
CC   gene therapy for treating an animal, particularly a human, suspected of
CC   having or being prone to a disease or condition associated with the
CC   expression of MP-1. In particular, the antisense oligonucleotides are
CC   useful for preventing, delaying or treating infection, inflammation or
CC   tumour formation. The present sequence is that of a human MP-1 antisense
CC   oligonucleotide, comprising a chimeric oligonucleotide gapmer 20
CC   nucleotides in length, composed of a central gap region of ten 2'-
CC   deoxynucleotides flanked by five nucleotide 2'-MOE wings

```

```
XX
PS   Example 1; Page 46; 52pp; English.
XX
CC   The present invention relates to the use of a DNA sequence comprising a
CC   fragment of a nucleic acid encoding a putative microbial virulence factor
CC   for the identification of a disease caused by mutations or for a genetic
CC   predisposition. The invention also relates to a method for identification
CC   of a disease which comprises detecting the presence of a mutation within
CC   a nucleic acid sequence of the fragment of virulence factor in a tissue-
CC   or blood sample of a subject, where the tissue sample is a foetal graft
CC   for neurotransplantation and where the sequence is inserted in the 3' UTR
CC   (untranslated region) of the gene and mutation is found in the
CC   polyadenylation signal of G1. The method is useful for identification of
CC   a disease caused by mutation or for their genetic predisposition where
CC   the disease is human disease which is from Alzheimer's disease,
CC   Parkinson's disease, schizophrenia, myopathy, other forms of dementias
CC   (frontotemporal lobe dementia, autosomal dominant Parkinson Lewy-Body
CC   dementia, hereditary multi-infarct dementia, familial British dementia,
CC   primary X-linked mental retardation) and where the human disease
CC   constitutes a predisposition or a genetic variation, the pathological
CC   manifestation of which is triggered by medicaments or drugs which is
CC   preferably cannabis, where the manifestation comprises any forms of
CC   dementia, schizophrenia or related psychiatric disorders. The invention
CC   also relates to transgenic animals (e.g. comprising a non-functional
CC   endogenous cannabinoid receptor (CB1) gene) which are useful for the
CC   identifying or screening of compounds that have an effect on the
CC   activity, expression or regulation of the translated protein (e.g. CB1
CC   protein). The present sequence is a DNA encoding human microtubule
CC   associated protein 2C (MAP2C) used in the exemplification of the
CC   invention

PT Detecting gene expression in a cell for analysis of gene chips or for
PT producing cDNA libraries, comprises permeabilizing the cells that are
PT captured on a filter or membrane, dissolving the isolated nuclei and
PT recovering the mRNA.
XX
PS Example 10; Page 14; 27pp; English.
XX
CC This invention relates to a novel method for isolating nuclear RNA and
CC detecting gene expression in a cell. The method comprises treating the
CC cells that are captured on a membrane with a cell membrane permeation
CC solution, such as NP-40, to increase their cell membrane permeability,
CC dissolving the nuclei after washing the cytoplasm and recovering the
CC mRNA. The method is useful for analysis of gene chips and microarrays,
CC diagnostic analysis by PCR, production of cDNA libraries, Northern blots
CC or differential display or subtraction library techniques. It is also
CC useful for detecting newly synthesised RNA without contamination from RNA
CC that is being degraded in the cytoplasm. The method of the invention
CC enables the treatment of a large number of specimens with only 2-3
CC minutes extra time required. Further, the method can be incorporated into
CC an automated system. The present sequence represents a human Jun-B mRNA
CC specific PCR primer used to quantitate UVC induced Jun-B gene expression
CC in an example of the method of the invention

PT Novel nucleic acid sequence encoding HPC2 polypeptide, which is marker
PT for prostate cancer, is useful in gene therapy techniques to restore HPC2
PT normal levels by which neoplastic growth is suppressed in recipient cell.
XX
PS Example 8; Page 74; 239pp; English.
XX
CC The invention relates to a human prostate cancer predisposing gene coding
CC for an HPC2 polypeptide. The DNA and protein sequences are useful as
CC diagnostic reagents for identifying a mutant HPC2 nucleotide sequence in
CC a suspected mutant HPC2 allele by comparing the sequence of the suspected
CC mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also
CC useful for detecting an alteration in HPC2, where the alteration is
CC associated with cancer in a human. The method involves analysing an HPC2
CC gene or an HPC2 gene expression product from a tissue of the human. The
CC HPC2 gene is useful as a marker for prostate cancer and can be used in
CC gene therapy techniques to suppress neoplastic growth of recipient cells
CC which carry the mutant HPC2 allele. The sequences represent primers used
CC in the methods of the invention, cDNA encoding human and mouse HPC2 and
CC cDNA encoding HPC2 paralogues and orthologues

PT Novel nucleic acid sequence encoding HPC2 polypeptide, which is marker
PT for prostate cancer, is useful in gene therapy techniques to restore HPC2
PT normal levels by which neoplastic growth is suppressed in recipient cell.
XX
PS Example 8; Page 74; 239pp; English.
XX
CC The invention relates to a human prostate cancer predisposing gene coding
CC for an HPC2 polypeptide. The DNA and protein sequences are useful as
CC diagnostic reagents for identifying a mutant HPC2 nucleotide sequence in
CC a suspected mutant HPC2 allele by comparing the sequence of the suspected
CC mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also
CC useful for detecting an alteration in HPC2, where the alteration is
CC associated with cancer in a human. The method involves analysing an HPC2
CC gene or an HPC2 gene expression product from a tissue of the human. The

```
CC   HPC2 gene is useful as a marker for prostate cancer and can be used in
CC   gene therapy techniques to suppress neoplastic growth of recipient cells
CC   which carry the mutant HPC2 allele. The sequences represent primers used
CC   in the methods of the invention, cDNA encoding human and mouse HPC2 and
CC   cDNA encoding HPC2 paralogues and orthologues

PT   Soil microorganism-originated formate dehydrogenase with e.g. specific
PT   activity, broad and stable functioning temperature and pH ranges, which
PT   is applicable in industrial production of formic acid.
XX
PS   Example 4; Page 46; 51pp; Japanese.
XX
CC   The invention relates to a formate dehydrogenase (ABB77565) with high
CC   specific activity, a small Km value for formic acid and NAD, being stable
CC   over a broad temperature range and a broad pH range, having a broad
CC   functioning pH and temperature range and being suitable for industrial
CC   production of formic acid. The dehydrogenase has specific activity, small
CC   Km values for formic acid and NAD, which produces only formic acid
CC   without accumulation of carbon dioxide in the system. The present
CC   sequence is that of a formate dehydrogenase related PCR primer, useful in
CC   examples of the invention

PT   Constructing strains for identifying gene products as effective targets
PT   for therapeutic intervention, by inactivating in the strain one allele of
PT   a gene and placing other allele of the gene under conditional expression.
XX
PS   Claim 36; SEQ ID NO 4519; 167pp + Sequence Listing; English.
XX
CC   The invention relates to constructing (M1) a strain of diploid fungal
CC   cells in which both alleles of a gene are modified, comprising modifying
CC   one allele by insertion or replacement by a cassette having an
CC   expressible selectable marker and modifying other allele by
CC   recombination, of a promoter replacement fragment with a heterologous
CC   promoter, so that expression of the second allele is regulated by the
CC   promoter. (M1) is useful for constructing a strain of diploid fungal
CC   cells in which both alleles of a gene are modified. The diploid fungal
CC   cells having both alleles modified are useful for identifying a gene that
CC   is essential to the survival or growth of a fungus, a gene that
CC   contributes to the virulence and/or pathogenicity of a fungus, a gene
CC   that contributes to the resistance of a diploid fungus to an antifungal
CC   agent, an antifungal agent that inhibits the growth of a diploid fungus
CC   and for identifying a therapeutic agent for treatment of a mammalian
CC   disease. (M1) is useful for identifying a compound which modulates the
CC   activity of a gene product, preferably enzymatic activity, carbon
CC   compound catabolism, biosynthetic, transporter, transcriptional,
CC   translational, signal transduction, DNA replication and cell division
CC   activity. The method is useful for identifying a compound having the
CC   ability to inhibit growth or proliferation of C. albicans cells and for
CC   treating infection by C. albicans. The present sequence is that of a PCR
CC   primer used in the method of the invention. Note: The sequence data for
CC   this patent is not represented in the printed specification but is based
CC   on sequence information supplied to Derwent by the European Patent Office

PT   Designing capture oligonucleotide probes for use on a support to which
PT   complementary oligonucleotides hybridize with little mismatch.
XX
PS   Example 5; Fig 29; 300pp; English.
XX
CC   The present invention describes a method (M1) for designing capture
CC   oligonucleotide probes (I) for use on a support to which complementary
CC   oligonucleotide probes (II) will hybridise with little mismatch, where
CC   (I) have melting temperatures within a narrow range. The method is useful
CC   for detecting infectious diseases caused by bacterial infectious agents
CC   e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC   infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC   Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC   Epstein-Barr virus and polio virus, and parasitic infectious agents
CC   selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus
CC   medinesis. The method is also useful for detecting genetic diseases such
CC   as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC   Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC   involved in DNA amplification, replication, recombination or repair, the
CC   cancer is specifically associated with a gene selected from BRCA1 gene,
CC   p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
CC   method is also used for environmental monitoring, forensics and the food
CC   and feed industry, detecting comprises scanning (using e.g. a scanning
CC   electron microscope and infrared microscope) the support at the
CC   particular sites and identifying if ligation of the oligonucleotide probe
CC   sets occurred and correlating (using a computer) identified ligation to a
CC   presence or absence of the target nucleotide sequences. ABI82074 to

PT Nucleic acid library comprising genes which are capable of initiation,
PT progression and suppression of an immune response, especially an immune
PT response observed with airway hyper-responsiveness of asthma.
XX
PS Example 8; Page 76; 120pp; English.
XX
CC The invention relates to a nucleic acid library comprising genes or their
CC fragments which are capable of modulating an immune response observed
CC with airway hyperresponsiveness and/or bronchoalveolar manifestations of
CC asthma. Also included are a method for modulating an immune response of
CC an individual comprising modulating a gene comprising a nucleic acid at
CC least functionally equivalent to a nucleic acid identifiable by a
CC signature sequence (SS) given in the specification such as R1-SO-R1-A11,
CC StO1-A10, SvO2-1-C11, StO1-A12, and R1-SO-R1-B7, a substance (for use as
CC a medicament) capable of modulating a gene comprising a nucleic acid at
CC least functionally equivalent to a nucleic acid identifiable by SS and
CC the use of a proteinaceous substance derived from a nucleic acid at least
CC functionally equivalent to a nucleic acid identifiable by SS for the
CC production of an antagonist (for use as a medicament) against the
CC substance. The antagonist and substance are useful for the treatment of
CC an immune response observed with airway hyperresponsiveness and/or
CC bronchoalveolar manifestations of asthma. The method is useful for
CC modulating the above immune response, where the gene encodes a gene
CC product capable of modulating the immune response. The substance is
CC useful for treating an immune response, particularly asthma, chronic
CC obstructive pulmonary disease (COPD), allergic diseases (rhinitis, atopic
CC dermatitis, urticaria), autoimmune diseases (e.g. multiple sclerosis),
CC inflammatory bowel disease, allograft rejection and infectious disease.
CC The present sequence is a PCR primer used to amplify and/or characterise
CC a mouse signature sequence of the invention

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 8846; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.

PT   Novel antisense oligonucleotide which is targeted to mRNA encoding human
PT   raf and which is capable of inhibiting raf expression, useful for
PT   treating or preventing hyperproliferative conditions such as cancer.
XX
PS   Disclosure; Page 31; 42pp; English.
XX
CC   The invention relates to an oligonucleotide 8-50 nucleotides in length
CC   which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a
CC   protein kinase playing a regulatory role in signal transduction,
CC   regulating cell proliferation and has been implicated in lung carcinoma),
CC   and which is capable of inhibiting raf expression. Also included is a
CC   composition comprising the oligonucleotide and a pharmaceutically
CC   acceptable carrier. The antisense oligonucleotide is useful for
CC   inhibiting the expression of human raf in human cells or tissues, by
CC   contacting the human cells or tissues with the oligo. The oligo. is also
CC   is useful for treating or preventing a disease or condition associated
CC   with the expression of raf by administering it in combination with a
CC   chemotherapeutic agent to a human or cells of the human, where the
CC   expression of raf is abnormal expression, and the condition is a
CC   hyperproliferative condition such as cancer, angiogenesis or
CC   neovascularisation (preferably ocular angiogenesis or
CC   neovascularisation). The oligo. is also useful for inhibiting
CC   hyperproliferation of cells. The oligos. are also useful as tools, for
CC   example for detecting and determining the role of raf expression in
CC   various cell functions and physiological processes and conditions and for
CC   diagnosing conditions associated with raf expression and for research
CC   purposes. The present sequence is an antisense oligonucleotide included
CC   in the sequence listing but not mentioned elsewhere in the specification

PT   New antisense oligonucleotide targeted to a nucleic acid encoding short
PT   heterodimer partner-1, useful for treating diseases involving abnormal
PT   lipid or cholesterol metabolism, e.g atherosclerosis or cardiovascular
PT   diseases.
XX
PS   Claim 3; Page 93; 121pp; English.
XX
CC   The invention relates to a novel compound of 8 - 50 nucleobases in length
CC   targeted to a nucleic acid molecule encoding a short heterodimer partner-
CC   1. The novel compound specifically hybridizes with a nucleic acid
CC   molecule encoding the short heterodimer partner-1, and inhibits the
CC   expression of the nucleic acid molecule. The compound, and a composition
CC   comprising it are useful for treating a disease or condition associated
CC   with the short heterodimer partner-1, particularly a condition involving
CC   abnormal lipid or cholesterol metabolism such as atherosclerosis or a
CC   cardiovascular disease. They are also useful in research and diagnostics
CC   for modulating the expression of short heterodimer partner-1. They can
CC   also be useful prophylactically in preventing or delaying infection,
CC   inflammation or tumour formation. This polynucleotide sequence represents
CC   a human antisense oligo relating to the heterodimer partner-1 of the
CC   invention

PT   Determining telomere length of mammalian chromosomal DNA by annealing and
PT   covalently binding telorettes, useful in assessing a potential anti-
PT   cancer treatment and/or assessing, treating or diagnosing male
PT   infertility.
XX
PS   Claim 23; Page 36; 50pp; English.
XX
CC   The present sequence represents a primer, which is used in the method of
CC   the invention for determining telomere length. The method comprises
CC   annealing the 3' end of a single-stranded oligonucleotide to a single-
```

```
CC   stranded overhang comprising TTAGGG repeat sequences, and covalently
CC   binding the oligonucleotide to the 5' end of the C-rich telomeric strand
CC   forming a ligation product. This ligation product is amplified to form a
CC   primer extension product, whose length is then detected. The method is
CC   useful in assessing potential anti-cancer treatments and cancer-related
CC   procedures. It can also be used in assessing telomere dynamics with age,
CC   effect of modulating telomerase activity, and in assessing, treating or
CC   diagnosing male infertility

PT   New halogen-tolerant formate dehydrogenase, useful as enzyme for
PT   regeneration of coenzyme in enzymatic reductions, is derived from
PT   Thiobacillus.
XX
PS   Example 4; Page 54; 102pp; Japanese.
XX
CC   The present invention relates to a novel halogen-tolerant formate
CC   dehydrogenase (ABR56300) from Thiobacillus sp. The enzyme is useful in
CC   industrial scale batch or continuous enzymatic reactions, including those
CC   using immobilised enzyme or a membrane reactor. In particular, the enzyme
CC   is efficient for the regeneration of coenzyme in enzymatic reductions,
CC   especially of alpha-haloketones such as ethyl 4-chloroacetoacetate, (1S)-
CC   3-chloro-2-oxo-1-benzylpropylcarbamic acid tert-butyl ester, 1-
CC   (benzoyloxy)-3-chloro-2-propanone and 2-chloroacetophenone. The present
CC   sequence is a PCR primer, which was used in an example from the invention

PT   New compound that hybridizes with and inhibits the expression of
PT   Phospholipase A2, group IIA, useful for preparing a composition for
PT   treating or preventing inflammation, cancer, psoriasis or diabetes.
XX
PS   Example 15; Page 90; 135pp; English.
XX
CC   The present invention describes a compound (I) comprising 8-50
CC   nucleobases which is targeted to a 5' untranslated region (UTR), coding,
CC   3' UTR or intron region of a nucleic acid molecule encoding phospholipase
CC   A2, group IIA (synovial), where the compound specifically hybridises with
CC   and inhibits the expression of phospholipase A2, group IIA (synovial).
CC   Also described: (1) a composition comprising the compound and a carrier
CC   or diluent; (2) a method of inhibiting the expression of phospholipase
CC   A2, group IIA in cells or tissues; and (3) a method of treating an animal
CC   having a disease or condition associated with phospholipase A2, group IIA
CC   (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and
CC   antipsoriatic activities, and can be used in vaccines and in gene
CC   therapy. The compound (I) can be used for preparing a composition for
CC   treating or preventing inflammation, cancer, psoriasis or diabetes. The
CC   present sequence represents a mouse phospholipase A2 group IIA (synovial)
CC   chimeric phosphorothioate antisense oligonucleotide, which is used in an
CC   example from the present invention

XX
PS   Claim 3; Page 79; 120pp; English.
XX
CC   The invention relates to antisense compounds targetted to a nucleic acid
CC   molecule encoding fibroblast growth factor (FGF) receptor 3 (also known
CC   as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense
CC   compounds of the invention are useful for treating diseases or conditions
CC   associated with FGFR-3 such as developmental disorders or
CC   hyperproliferative disorders, especially cancer of colorectal, bladder,
CC   bone, lung, cervical, breast or skin. They are useful as research
CC   reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools
CC   in differential and/or combinatorial analyses to elucidate expression
CC   patterns of a portion of the genes expressed within cells and tissues.
CC   They are also useful in antisense therapy. The present sequence is an
CC   antisense oligonucleotide targetted to human FGFR-3

PT   Detecting point mutation in DNA strand, by hybridizing target DNA strand
PT   having mutation with test DNA strand to form duplex, contacting the
PT   duplex with RNase H and determining the cleavage of test strand by RNase
PT   H.
XX
PS   Example 5; Fig 4; 26pp; English.
XX
CC   The invention relates to a novel method for detecting a point mutation in
CC   a DNA strand. The novel method comprises hybridising a target DNA strand
CC   containing or suspected of containing a point mutation with a test
CC   nucleic acid strand complementary to the DNA strand to form a target DNA
CC   strand/test nucleic acid strand duplex, contacting the duplex with an
CC   RNase H, and determining whether the ribonucleotide residues within the
CC   nucleotide sequence are cleaved by RNase H. The method is useful for
CC   detecting a point mutation in a DNA strand, where the point mutation to
CC   be detected is a single nucleotide polymorphism, preferably a
CC   polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian
CC   or human genome. The method is useful to detect any nucleic acids from
CC   any species of organisms such as Acintobacter, Bacillus, Candida,
CC   Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
CC   This polynucleotide sequence represents an oligo relating to the mutation
CC   detecting method of the invention

PT   New atlastin gene, useful for preparing a composition for treating
PT   Hereditary Spastic Paraplegia (HSP) or for identifying subjects who have,
PT   or at risk of developing, HSP.
XX
PS   Example 6; Page 102; 111pp; English.
XX
CC   The present invention describes human atlastin, which is located to
CC   chromosome 14 (more specifically to 14q22.1). Also described: (1) an
CC   isolated atlastin polypeptide; (2) identifying subjects who have, or are
CC   at risk of developing, hereditary spastic paraplegia (HSP); (3) a kit for
CC   determining if a subject has, or at risk of developing, HSP; (4) a
CC   computer readable medium encoding a representation of the atlastin
CC   nucleic acid sequence or polypeptide; (6) identifying subjects at risk of
CC   carrying an allele for HSP; and (7) treating a patient with HSP. Atlastin
CC   has neuroprotective activity and can be used in gene therapy. The
CC   atlastin nucleic acid is useful for preparing a composition for treating
CC   HSP or for identifying subjects who have, or at risk of developing, HSP.
CC   The present sequence represents an atlastin intronic splice site
CC   oligonucleotide, which is given in an example from the present invention

PT Inducing differentiation of mammalian embryonic stem (ES) cells into
PT functioning cells, for treating e.g. diabetes, comprises culturing ES
PT cells in a medium containing leukemia inhibitor factor and basic
PT fibroblast growth factor.
XX
PS Example 1; Page 63; 70pp; English.
XX
CC The present invention relates to a method of inducing differentiation of
CC mammalian embryonic stem cells into functioning cells, which comprises
CC culturing embryonic stem cells in a medium comprising leukaemia inhibitor
CC factor and basic fibroblast growth factor. In particular, the invention
CC relates to the differentiation of murine embryonic stem cells. The method
CC is useful for inducing differentiation of mammalian embryonic stem cells
CC into functioning cells. Other methods are useful for treating a mammalian
CC patient having disorders in pancreatic function, and in nerve function.
CC The cells are pancreatic islet like cell clusters and nerve like cells.
CC Functioning cells induced from embryonic stem cells using the present
CC method may be used for treating disorders in pancreatic islet function
CC (e.g. diabetes), neuronal degeneration (e.g. Alzheimer's disease and
CC Creutzfeldt-Jakob disease) or spinal cord disorders. The functioning
CC cells are useful not only for cell transplant therapy, but for in vitro
CC screening of various new drugs which affect or restore islet or nerve
CC function, and for safety evaluation of new drugs. The present sequence is
CC a PCR primer used in the exemplification of the invention

PT Amplifying expressed genetic sequences from genomic DNA of mammalian or
PT higher order plant species for printing on DNA microarrays, involves
PT using the 3' untranslated region of the gene sequence.
XX
PS Disclosure; Page 7; 15pp; English.
XX
CC The invention discloses a method for amplifying expressed genetic
CC sequences from genomic DNA (gDNA) from mammalian or higher order plant
CC species. The method involves identifying a 3' untranslated region (UTR)
CC of a gDNA sequence, designing probe, performing PCR, separating the
CC product by size differentiation and performing a second PCR to amplify
CC the predetermined sequence. Also claimed is a biological analysis device,
CC comprising a substrate and an array of a set of expressed genetic
CC sequences, located on the substrate, which are generated by the method
CC above and a DNA high-density microarray comprising a substrate upon which
CC are deposited an array of biosites of genomic DNA fragments having the
CC sequence of at least one exon, and absent polyadenine and vector
CC sequences, where the genomic DNA fragments have a sequence length of from
CC about 75-2000 nucleotides. The method is efficient for amplifying gene
CC sequences, enables large-scale production of gDNA sequences, generates
CC large quantities of gDNA probes, which enables greater efficiency for
CC printing in microarray formats, fabricates high-density DNA arrays of
CC enhanced, widely varying genetic content and abstains from using RNA-
CC derived sequences by simple PCR amplifications without cloning. The
CC method produces amplified sequences that have greater specificity and
CC size consistency than that observed with cDNA fragments, and allows for
CC greater signal sensitivity than oligonucleotides. The sequence presented
CC is a Type II gene specific primer

PT Treatment of airway diseases such as asthma - by topically applying
PT adenosine-free antisense oligo:nucleotide to airway epithelium of
PT subject.
XX
PS Example 5; Page 43; 71pp; English.
XX
CC A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide specific
CC for endothelial nitric oxide. The method can be used to treat airway
CC diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary
CC disease, bronchitis and other airway diseases characterised by an
CC inflammatory response. By eliminating adenosine from the antisense ON,
CC its liberation upon antisense degradation is prevented, thereby
CC preventing adenosine-induced bronchoconstriction in patients with hyper-
CC reactive airways

XX
PS Disclosure; Fig 7; 605pp; English.
XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

XX
CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
```

```
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Claim 18; Page 444; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
```

```
PS   Claim 14; Page 251; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Novel nucleic acid construct for cell type-specific expression of
PT   therapeutic transgene, comprising a cell type-specific promoter operably
PT   linked to therapeutic gene, and amplification promoter element.
XX
PS   Example 1; Page 29; 33pp; English.
XX
CC   The sequences given in AAC86173-74 are primers which were used to
CC   identify the minimal melanoma-specific promoter of the human tyrosinase
CC   gene. The identified fragment corresponding to bases -300 to -1 and is
CC   designated Tyr300. Tyr300 is a subsequence of the 5' untranslated region
CC   of the human tyrosinase gene and contains at least four positive DNA
CC   binding elements as one as one negative element. The M box, found at -107
CC   to -97 is a conserved element found in other melanocyte-specific
CC   promoters. When Tyr300 is incorporated into a recombinant construct, it
CC   functions as a highly selective activator for transgene expression in
CC   melanoma cells. Constructs such as these are useful for gene therapy of
CC   tumours such as melanoma, cancers, genetic diseases and other ailments
CC   amenable to gene therapy

XX
```

PS Claim 1; Page 68; 96pp; English.
XX
CC The invention relates to a nucleic acid comprising single nucleotide
CC polymorphisms (SNPs) associated with diseases. The nucleic acids
CC comprising the SNPs and probes and primers for detecting them may be used
CC in assays for the diagnosis of diseases associated with SNPs (such as
CC sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan
CC syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease,
CC familial hypercholesterolaemia, polycystic kidney disease, hereditary
CC spherocytosis, Von Willebrand's disease, tuberous sclerosis, hereditary
CC haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos
CC syndrome, osteogenesis imperfecta, and acute intermittent porphyria,
CC symptoms of, or susceptibility to, multifactorial diseases of which a
CC component is or may be genetic, such as autoimmune diseases,
CC inflammation, cancer, diseases of the nervous system, and infection by
CC pathogenic microorganisms, autoimmune diseases including rheumatoid
CC arthritis, multiple sclerosis, diabetes (insulin-dependent and non-
CC independent), systemic lupus erythematosus and Graves disease, cancers
CC including cancers of the bladder, brain, breast, colon, oesophagus,
CC kidney, leukaemia, liver, lung, oral cavity, ovary, pancreas, prostate,
CC skin, stomach and uterus, longevity, appearance (e.g., baldness,
CC obesity), strength, speed, endurance, fertility, and susceptibility or
CC receptivity to particular drugs or therapeutic treatments), in forensics
CC and in paternity testing. ABK65381-ABK65841 represent human single
CC nucleotide polymorphisms of the invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 10806; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT Protein TCH169 with dicarboxylate transport activity for treatment and
PT diagnosis of diseases including liver disease, cancer and circulatory
PT disorders.
XX
PS Example 2; Page 103; 132pp; Japanese.
XX
CC The present invention describes protein TCH169 and its salts having
CC dicarboxylate transport activity. TCH169 has hepatotropic, cytostatic,
CC nephrotropic, vasotropic and antidiabetic activities. The TCH169 protein
CC and polynucleotide can be used in the treatment, prevention and diagnosis
CC of liver disease (such as hepatitis, hepatic sclerosis and alcohol-
CC related liver disease); prostate disease (such as prostatitis and
CC prostatic hypertrophy); spleen disease (such as spleen hyperactivity);
CC kidney disease (such as nephritis, kidney failure, nephritis, dropsy and
CC diabetes-associated renal disease); metabolic disease (such as diabetes);
CC circulatory disease (such as hyperlipaemia and arteriosclerosis); and
CC cancer (such as non-small cell lung cancer, liver cancer, renal cancer,
CC ovarian cancer, prostate cancer, stomach cancer, pancreatic cancer,
CC breast cancer, colon cancer, bladder cancer and womb cancer). The present
CC sequence represents a PCR primer for human TCH169, which is used in an
CC example from the present invention

PT Detection of particular plant species, especially in food products - by
PT extracting chloroplast DNA from the product and detecting a sequence
PT which is characteristic of the plant species.
XX
PS Claim 20; Page 19; 31pp; English.
XX
CC AAV26085-V26096 are PCR primers used in a method of detecting a
CC particular plant species in a product, in this case orange and mandarin.
CC The method involves extracting chloroplast DNA from the product and
CC analysing the DNA to detect a sequence which is characteristic of the
CC particular plant species. The example used is a method for detecting the
CC presence of C. reticulata (mandarin) in a sample containing C. sinensis
CC (orange) which involves extracting DNA from the sample, carrying out an
CC amplification reaction using primers which are able to amplify a region
CC of DNA comprising part of the C. reticulata 1120 bp sequence given in the
CC specification, but not the corresponding part of the C. sinensis 1140 bp
CC sequence also given in the specification, and detecting the presence of
CC amplified product. This method can be used for detecting or identifying
CC plants or plant derived material within food products. It can be used to
CC detect certain fruit species in particular citrus fruits such as
CC mandarin, e.g. within fruit containing food products or juice products,
CC or particular oil components such as olive oil, to determine the
CC authenticity of the products. The analysis by PCR amplification and
CC restriction fragment length polymorphism (RFLP) analysis of chloroplast
CC DNA can be used to distinguish between closely related plant species,
CC including species which are closely related

PT   Detecting and differentiating between hematopoietic cell proliferative
PT   disorders, comprises contacting a target nucleic acid with a reagent that
PT   distinguishes between methylated and non-methylated CpG dinucleotides.
XX
PS   Claim 11; Page 37; 117pp; English.
XX
CC   The present invention describes a method for detecting and
CC   differentiating between haematopoietic cell proliferative disorders
CC   associated with at least 1 gene and/or their regulatory regions in a
CC   subject. The method comprises contacting a target nucleic acid in a
CC   biological sample obtained from the subject with at least 1 reagent,
CC   which distinguishes between methylated and non-methylated CpG
CC   dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
CC   represent specifically claimed nucleotide sequences from the present
CC   invention. Oligonucleotides from the present invention can be used: for
CC   differentiating between healthy haematopoietic cells and proliferative
CC   disorder haematopoietic cells; for differentiating between acute
CC   lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC   determining the cytosine methylation state and/or single nucleotide
CC   polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC   related sequences and their complements; and as primers for the
CC   amplification of haematopoietic cell proliferation disorder related DNA
CC   sequences. The nucleotide sequences from the present invention can also
CC   be used for detecting a predisposition to, differentiation between
CC   subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC   haematopoietic cell proliferative disorders. The present method enables a
CC   highly specific classification of haematopoietic cell proliferative
CC   disorders allowing for improved and informed treatment of patients

PT   cell- or tissue-specific targeting systems.
XX
PS   Example 3; Page 12; 20pp; English.
XX
CC   The present invention describes a mouse (I), homozygous for a disruption
CC   in the alpha-L-iduronidase (IDUA) gene but with normal expression of the
CC   hepatic sulphate transporter SAT-1 gene. (I) is used to evaluate
CC   therapeutic agents for use in treating mucopolysaccharidosis Type I (MPS
CC   I) by administering the agent to (I) and evaluating the mouse for
CC   pathology associated with iduronidase deficiency. (I) may also be used to
CC   evaluate the ability of a targeting system to deliver a therapeutic agent
CC   to a specific tissue or organ in the mouse using the same techniques.
CC   Targeting systems which may be tested using this regime include a target-
CC   specific label, a viral expression vector or a liposome coupled to
CC   iduronidase. (I) may also be used as a general model for studying the
CC   pathology of MPS I. The SAT-1 gene overlaps with the IDUA gene but in (I)
CC   the expression of the SAT-1 gene is unaffected. Therefore any
CC   pathological effects observed in (I) are due solely to the disruption of
CC   the IDUA gene. The present sequence represents a IDUA genomic DNA
CC   oligonucleotide used in the exemplification of the present invention

PT Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT sample comprising the complex with ligand that binds to a component of
PT the complex and separating complex by binding ligand with a binding
PT molecule.
XX
PS Example 6; Page 31; 49pp; English.
XX
CC The specification describes a method for partitioning endogenous cellular
CC mRNA-protein (mRNP) complexes. The method comprises contacting a
CC biological sample comprising mRNP complex with ligand that specifically
CC binds a component of mRNP complex, separating mRNP complex by binding the
CC ligand with a molecule specific for ligand, which is attached to the
CC solid support and then collecting the mRNP complex by removing the
CC complex from the support. The method is useful for in vivo partitioning
CC of cellular mRNA protein complexes in a biological sample. The method is
CC useful for determining the ribonomic profile of a cell which has numerous
CC uses including monitoring of tumour development, state of growth or state
CC of development, perturbations of a biological system such as disease,
CC drug or toxin treatment and the state of cell aging or death,
CC distinguishing ribonomic profiles among organisms, to discriminate
CC between transcriptional and post-transcriptional contributions to gene
CC expression and to track the movement of RNAs through RNP complexes,
CC including the interactions of combinations of proteins with RNAs in RNP
CC complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC untranslated region (UTR) of mRNA of various genes. The sequences contain
CC target sequences for RNA-binding proteins

PT   New genetic variants of Glutathione reductase isogenes, useful for
PT   improving efficiency and reliability in drug development for treating
PT   hemolytic anemia.
XX
PS   Claim 14; Page 14; 137pp; English.
XX
CC   The present invention describes genetic variants of the human glutathione
CC   reductase (GSR) gene (I). (I) has antianaemic activity and can be used in
CC   gene therapy. (I) can be used in screening for drugs targeting (I) that
CC   are useful for treating haemolytic anaemia. Methods from the present
CC   invention can be used: for improving the efficiency and reliability of
CC   several steps in the discovery and development of drugs for treating
CC   diseases associated with GSR activity; for haplotyping, which is also
CC   used by the pharmaceutical research scientist to validate GSR as a
CC   candidate target for treating a specific condition or disease predicted
CC   to be associated with GSR activity, e.g. haemolytic anaemia, and in the
CC   design of clinical trials for treating a specific condition of disease
CC   associated with GSR activity; and for screening compounds targeting GSR.
CC   (I) is useful in studying the expression and function of GSR, and in
CC   expressing GSR protein for use in screening for candidate drugs to treat
CC   diseases related to GSR activity. (I) is also useful in studying the
CC   effect of the variation on the biological activity of GSR as well as on
CC   the binding affinity of candidate drugs targeting GSR for the treatment
CC   of haemolytic anaemia. The present sequence represents an allele specific
CC   oligonucleotide (ASO) primer for the human GSR gene, which is given in
CC   the exemplification of the present invention. N.B. The polymorphic base
CC   (showing a single nucleotide polymorphism) in the ASO primer is shown
CC   using an IUPAC ambiguity code (as given in the present invention)

PT   Identifying Frizzled-4 (FZD4) gene modulators for treating e.g. familial
PT   exudative vitreoretinopathy or Coat's disease, comprises contacting a
PT   compound with an FZD4 polypeptide or with a cell expressing FZD4
PT   polypeptide.
XX
PS   Disclosure; Page 103; 116pp; English.
XX
CC   The invention relates to a novel method for identifying a Frizzled-4
CC   (FZD4) modulating agent. The method comprises contacting a compound with
CC   an FZD4 polypeptide or with a cell expressing an FZD4 polypeptide, and
CC   determining the difference in the biological activity or expression of
CC   the FZD4 polypeptide compared with when the compound is not present. The
CC   immunodulatory compounds of the invention can have the follwing
CC   activities of ophthalmological, vasotropic, antiinflammatory, vulnerary,
CC   osteopathic, antimicrobial, antipsoriatic, and antidiabetic. The method
CC   is useful for identifying modulators of FZD4, and such modulators are
CC   useful in treating diseases related to Fzd-4 expression or activity. The
CC   modulators are particularly useful in treating e.g. familial exudative
CC   vitreoretinopathy, retinopathy of prematurity, Coat's disease, Norrie
CC   disease, retinal angiomatosis, ocular toxocariasis, retinoblastoma,
CC   retinal dysplasia, neovascular inflammatory vitreoretinopathy or
CC   retinitis pigmentosa. The modulators are also useful for treating other
CC   diseases involving the physiological and pathological processes of
CC   neovascularisation, such as indications that may require stimulation of
CC   neovascularisation (e.g. myocardial ischaemia, coronary artery disease,
CC   wound healing, or fracture and tendon repair), indications that may
CC   require inhibition of neovascularisation (e.g. cancer tumour growth and
CC   metastatis, ocular neovascularisation, bone and cartilage destruction,
CC   inflammatory and infectious diseases), indications that require vascular
CC   remodeling (e.g. psoriasis or pre-eclampsia), and indications that
CC   require inhibition of neovascularisation (e.g. respiratory distress,
CC   peritoneal sclerosis, or diabetes). This polynucleotide sequence
CC   represents an oligo relating to the FzD4 gene of the invention.

CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
```

```
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent

PT   Thrombopoietin polypeptide which specifically stimulates or increases
PT   platelet production - useful in treatment of thrombocytopenia, also
PT   related DNA and vectors.
XX
PS   Example 24; Page 139; 383pp; English.
XX
CC   AAQ99589-Q99592 represent amplification primers based on regions of a
CC   thrombopoietin (TPO) cDNA (see AAQ99553). These primers were used to test
CC   for the presence of TPO DNA in a phage comprising a human cDNA library.
CC   TPO is a humoral factor capable of promoting platelet production. The
CC   protein encoded by the full length sequence can be purified by using a
CC   gel affinity column where Mpl has been coupled to a resin. AAQ99551 and
CC   AAQ99552 also encode TPO proteins. The full length DNA sequences are
CC   inserted into vectors which are used to transform prokaryotic and
```

```
CC   eukaryotic host cells. Using the proteins encoded by the full length
CC   sequences, and derivatives of them, antibodies specifically
CC   immunoreactive with a TPO protein can be created. The antibodies, DNA
CC   sequences and vectors are used to isolate the protein sequences. The TPO
CC   proteins can then be used in the treatment of platelet disorders. These
CC   include thrombocytopenia, hypoplastic anaemia, AIDS, disseminated
CC   intravascular coagulation syndrome and thrombotic thrombocytopenia.

PT   New octa:nucleotide with guanosine quartet and phosphoro:thioate links -
PT   is inhibitor of HIV infection by binding to the V3 loop.
XX
PS   Example 3; Col 8; 14pp; English.
XX
CC   AAT34998-T35001 represent HIV inhibitors. Sequences containing only G and
CC   T residues (such as these sequences) are triplex forming
CC   oligonucleotides, and form purine rich promoter elements used to inhibit
CC   transcription. These sequences bind to the HIV gp120 protein at the V3
CC   loop via the internal guanosine quartet. This binding prevents cell-to-
CC   cell and virus-to-cell infection. The sequences may also be used for
CC   inhibiting viral growth, and other viral genes, for inhibiting the enzyme
CC   PLA2, and to modulate telomere length. In some cases these sequences need
CC   to be chemically modified. The chemically modified oligonucleotides
CC   preferably include at least one phosphorothioate linkage. Other modified
CC   intersugar links, or 2'-modified sugar residues can also be used. These
CC   oligonucleotides can be used for coating gloves, condoms, etc, or for
CC   topical application. (Updated on 25-MAR-2003 to correct PF field.)

PT   New oligo:nucleotide with affinity for non-linear target - includes a
PT   sequence preventing canonical interaction but able to form a complex,
PT   used to prevent development of viruses, bacteria and parasites.
XX
PS   Example 2; Page 22; 48pp; French.
XX
CC   The oligonucleotides AAT10455-82 represent examples of novel
CC   oligonucleotides designated 'Aptastruc'. The oligonucleotides have
CC   affinity for non-linear target sequences e.g a self-annealed hairpin
CC   structure. They have a complementary sequence to part of the linear
CC   (stem) of the target whereas the remainder (i.e. either end) of the
CC   oligonucleotide does not interact with the target sequence. The
CC   oligonucleotides presented here are targeted to the TAR region of HIV,
CC   which binds to the tat protein during viral development. The novel
CC   oligonucleotides are generally targeted to regulatory elements such as a
CC   mini-exon from trypanosomes, the HIV TAR or an iron response element.
CC   They may either bind to the target sequence to interfere with its
CC   regulatory role or may contain a functional group e.g. a ribozyme to
CC   cleave the target sequence

CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT   New DNA methyltransferase nucleotide sequences - used particularly to
PT   develop antisense oligonucleotides for diagnostic and therapeutic
PT   purposes, particularly for inhibiting tumour growth.
XX
PS   Example 8; Page 31; 108pp; English.
XX
CC   PCR primers AAV99163-220 were used to map the intron boundaries of the
CC   exons of DNA methyltransferase (DNA MeTase) genomic sequence. Antisense
CC   oligonucleotides which inhibit inhibit DNA MeTase expression can be
CC   derived from the genomic DNA MeTase sequence. The antisense
CC   oligonucleotides can be used in investigating the role of DNA MeTase in
CC   cellular growth. They can be administered at different points in the cell
CC   cycle, or in conjugation with promoters or inhibitors of cell growth to
CC   determine the role of DNA MeTase in the growth of the cell type of
CC   interest. The antisense oligonucleotides can also be used for inhibiting
CC   tumour growth in a mammal, or to activate silenced genes to provide a
CC   missing gene function. This ameliorates disease symptoms, e.g. in beta
CC   thalassemia and sickle cell anemia. The antisense oligonucleotides can
CC   also be used an analytical and diagnostic tools and a potentiators of
CC   transgenic plant and animal studies

PT   New coding sequence haplotypes of the human BRCA2 gene - used to develop
PT   products for determining susceptibility to, detection and treatment of
PT   breast or ovarian cancer.
XX
PS   Example 1; Page 32; 226pp; English.
XX
CC   The present invention describes genomic DNA which contains a BRCA2 gene
CC   where the first 12 nucleotides beginning exon 5 are 5'-TCCTGTTGTTCT-3' as
CC   in sequence (I) (see AAX03249), where nucleotides numbers 5782-5790 are
CC   GTTTGTGTT as in sequence (IV) (see AAX30255), and where the last 20
CC   nucleotides encoding exon 15 are 5'-CTGCGTGTTCTCATAAACAG-3' as in
CC   sequence (II) (see AAX30251) and the first 20 nucleotides beginning exon
CC   16 are 5'-CTGTATACGTATGGCGTTTC-3' as in sequence (III) (see AAX30253).
CC   Products and methods from the present invention can be used for
CC   identifying mutations in the BRCA2 gene leading to predisposition or
CC   higher susceptibility to breast or ovarian cancer. They can also be used
CC   for detection and gene therapy for breast and ovarian cancers. They can
CC   be used in methods for monitoring disease progression, for determining
CC   patients suited for gene and protein replacement progression, or for
CC   detecting the presence or quantifying the amount of a tumour growth
CC   inhibitor following such therapy. The BRCA2 protein, polypeptides, their
CC   functional equivalents, antibodies, and PNs may also be useful in the
CC   study of the characteristics of BRCA2 proteins, such as structure and
CC   function of BRCA2 in oncogenesis or subcellular localisation of BRCA2
CC   protein in normal and cancerous cells. AAX33001 to AAX33097 represent PCR
CC   primers used in the amplification of the human BRCA2 gene

PT   Novel nucleic acid used for genotyping, e.g. to predict rate of drug
PT   metabolism.
XX
PS   Claim 2; Page 16; 46pp; English.
XX
CC   Sequences AAZ59305-Z59352 are fragments of the human STP2 gene. The
CC   fragments are from the 8 exons, the promoter region, 3' and 5'
CC   untranslated regions of the STP2 gene. Each sequence contains a newly
CC   identified STP2 gene single nucleotide polymorphism (SNP). STP2 is a
CC   phenol sulphotransferase. Substrates for STP2 include minoxidil,
CC   acetaminophen, and paranitrophenol. Several of the nucleotide changes
CC   identified at the polymorphism sites, give rise to an amino acid change.
CC   Amino acid changes may result in altered enzyme activity. The sequences
CC   can be used as probes for detecting STP2 polymorphisms. The polymorphic
CC   probes are used in screening and genotyping, i.e. to predict the rate of
CC   metabolism of STP2 substrates, potential drug-drug interactions and
CC   adverse side effects. They can also be used to detect diseases resulting
CC   from accidental or occupational exposure to toxins and to establish
CC   animal, cell or in vitro models for drug metabolism

PT   Novel MUC nucleic acid corresponding to mucin gene, useful for treating
PT   associated disease conditions e.g. colorectal, breast cancer, cystic
PT   fibrosis and inflammatory bowel disease.
XX
PS   Example 7; Page 40; 103pp; English.
XX
CC   The invention provides mucin genes (MUC11 and MUC12) located on human
CC   chromosome 7q22. The mucin genes or its portion is used in detecting
CC   polymorphism, mutation, deletion, truncation and expansion in the gene or
CC   its gene transcript. Pharmaceutical compositions and gene therapy
CC   constructs comprising the mucin genes are used for treating disease
CC   conditions associated with aberrant Mucin expression, altered properties
CC   of mucus or epithelial inflammatory processes involving Mucins like
CC   Crohn's disease, ulcerative colitis, asthma, chronic bronchitis and
CC   colorectal cancer, cystic fibrosis, inflammatory bowel disease and breast
CC   cancer. The mucin genes and the polypeptides are used for determining
CC   these diseases or their predisposition. The MUC11 and MUC12 polypeptides
CC   are used for preparing antagonist and antibodies. Sequences AAZ58833-34

XX
CC   The present sequence represents a G-motif oligonucleotide of the
CC   invention. The specification describes compositions comprising G-motif
CC   oligonucleotides. The G-motif oligonucleotides inhibit activation of
CC   antigen presenting cells by inhibiting the uptake of DNA by a cell, by
CC   stimulating natural killer cells, or by co-stimulating cytotoxic T-
CC   lymphocytes. The G-motif oligonucleotides may be used for the productions
CC   of vaccines for treating septic shock, inflammation, autoimmune diseases
CC   (e.g. rheumatoid arthritis, Crohn's disease, sarcoidosis, multiple
CC   sclerosis, Kawasaki syndrome, graft-versus-host disease and transplant
CC   rejection), helper T cell response 1-mediated diseases (e.g.
CC   Streptococcal induced arthritis, Lyme arthritis, chronic inflammatory
CC   bowel disease, psoriasis vulgaris, experimental allergic
CC   encephalomyelitis, and insulin-dependent diabetes mellitus), bacterial
CC   infections, parasitic infections (e.g. Leishmaniasis or Toxoplasmosis),
CC   viral infections (e.g. Cytomegalovirus and human immunodeficiency virus
CC   (HIV)-infections), spontaneous abortions and tumours. They may also be
CC   used to induce proliferation of bone marrow cells, especially macrophage
CC   precursor cells

PT   Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
PT   useful for detecting specific nucleic acids, e.g. for single-nucleotide
PT   mismatch discrimination.
XX
PS   Example 9; Page 78; 105pp; English.
XX
CC   The present sequence is that of a mismatched target sequence for an
CC   oligonucleotide (ODN)-minor groove binder (MGB)-latent fluorophore (LF)
CC   conjugate of the invention. It contains a single nucleotide mismatch to
CC   the ODN moiety of the conjugate, and was used to demonstrate the use of
CC   ODN-MGB-LF conjugates as primers in real-time PCR. The template was the
CC   4518 bp pBK-CMV phagemid. The template contained a LacZ gene insert in
CC   which the region between nucleotides 1060 and 1083 was substituted with
CC   either the present mismatched target sequence, or with the matched target
CC   sequence given in AAF30890. Primers (see AAF30892-94) were chosen to
CC   produce a 42 bp amplicon. A strong fluorescence output was observed for
CC   the template with the perfectly-matched sequence, but only background
CC   fluorescence was observed for the template with the single-base mismatch

PT   New peptides having inhibitory function to gene transcription for
PT   preparation of plants with reduced allergen.
XX
PS   Example; Page 3; 13pp; Japanese.
XX
CC   The present invention describes gene transcription inhibitory peptides.
CC   The peptides having a gene transcription inhibitory function are encoded
CC   by the Arabidopsis thaliana ethylene responsive element binding factor 4
CC   (AtERF4) 795 base sequence, or comprises a sequence of 40 amino acids or
CC   a derivative with deleted, replaced or added amino acid(s) of AtERF4. The
CC   peptides have antiallergic activity and can be used in gene therapy. The
CC   peptides can be used in the preparation of plants with reduced allergen.
CC   The present sequence represents a PCR primer for AtERF4, which is used in
CC   an example from the present invention

PT   Novel oligonucleotide label-domain for incorporation into oligonucleotide
PT   probes useful for detecting or localizing nucleic acid target genes
PT   within a cell or tissue sample.
XX
PS   Example 4; Page 19; 71pp; English.
XX
CC   The present invention relates to a new oligonucleotide label-domain
CC   comprising the sequence (CTATTTT)_n and its complement (AAAATAG)_n, where
CC   n is 1. The probe sets of the invention are useful for detecting kappa or
```

```
CC   lambda-immunoglobulin light chain mRNA or corresponding heteronuclear
CC   RNA, CMV (cytomegalovirus) immediate early RNA, EBV (Epstein-Barr virus)
CC   early RNA 1 and RNA 2, and human Alu repetitive satellite genomic
CC   sequences. The invention is a useful generic sequence for incorporation
CC   into oligonucleotide probes for detecting gene-specific sequences within
CC   cells or tissue samples in in situ hybridisation analysis and for
CC   attaching a label to immunoglobulins or other proteins for detecting
CC   haptens and antigens in immunohistochemical analyses. The present nucleic
CC   acid sequence represents one of a collection (ABK70376-ABK70501) of
CC   oligonucleotide probes that were used in the invention for detecting or
CC   localising a plurality nucleic acid target gene or antigen within a cell
CC   or tissue sample

XX
CC   The present invention relates to the preparation of DNA, in a circular
CC   vector, that encodes one or more segments of a modular polypeptide. DNA
CC   or DNA libraries produced this way are used to produce modular
CC   polypeptides, particularly enzymes, which can be used to act on
CC   substrates to produce compounds for therapeutic testing. Enzymes of
CC   particular interest are those involved in non-ribosomal peptide synthesis
CC   or polyketide synthesis, and compounds for testing are particularly
CC   macrolide antibiotics, including penicillins, vancomycins or
CC   erythromycins, but may also be modular receptors. The present sequence is
CC   a fragment of a Streptomyces chrysomallus actinomycin biosynthesis gene
CC   which was used in the exemplification of the invention

XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
```

CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC The polymorphisms in the human genes cited in the invention are useful as
CC genetic linkage markers for locating and characterising the genes that
CC are responsible for specific traits within the genome and eventually
CC identifying the genes responsible for a variety of disorder-related
CC traits as a result of their e.g., overexpression, constitutive
CC expression, mutation or underexpression, which may be used in diagnosing
CC and/or treating the disorders. The nucleic acid molecules comprising the
CC polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC used to screen for altered cardiovascular function, in COX2 for altered
CC susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC nervous system function, in FLAP and HNMT for altered pulmonary,
CC immunological or haematological function, in KLK2 for altered serine
CC protease activity in the prostate, in LTF for altered immunological or
CC haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC peripheral nervous system function. The present sequence represents a PCR
CC primer used to amplify the sequences of the invention

PT   Novel composition comprising purified mammalian calcium independent
PT   phospholipase enzyme, useful for the screening of inhibitors of
PT   phospholipase activity, is active in the absence of calcium.
XX
PS   Example 6; Page 9; 41pp; English.
XX
CC   The invention relates to a purified mammalian calcium independent
CC   cytosolic phospholipase A2/B (cPLA2/B) enzyme. The cPLA2/B enzyme is
CC   characterized by activity in the absence of calcium and has a molecular
CC   weight of 86 kD on SDS-PAGE. A composition (I) comprising a purified
CC   calcium independent phospholipase enzyme is useful for identifying an
CC   inhibitor of phospholipase activity which involves combining (I),
CC   phospholipid and candidate inhibitor compound, and observing whether the
CC   enzyme cleaves the phospholipid and releases fatty acid from it. A
CC   pharmaceutical composition (PC) comprising a therapeutically effective
CC   amount of the inhibitor is useful for reducing inflammation and for
CC   treating inflammatory conditions including rheumatoid arthritis,
CC   psoriasis, asthma, inflammatory bowel disease and other diseases mediated
CC   by increased levels of prostaglandins, leukotriene or platelet activating
CC   factor. A composition comprising an antibody which binds to (I) is useful
CC   as research and diagnostic tool, and is also useful in the study of
CC   phospholipase A2 activity and inflammatory conditions. The present
CC   sequence represents a cPLA2/B enzyme mutagenising oligonucleotide

PT New isolated NOVX polypeptide useful for treating cardiomyopathy,
PT atherosclerosis, metabolic disorders, diabetes, obesity, infectious
PT disease, anorexia, neurodegenerative disorders, Alzheimer's disease and
PT cancer.
XX
PS Example 3; Page 462; 479pp; English.
XX
CC The invention relates to an isolated polypeptide termed NOVX (NOV1, 2a,
CC 2b, 3a, 3b, 4a, 4b, 5, 6, 7a-c, 8a-e, 9a-b, 10, 11, 12a-c, 13, 14, 15,
CC 16a-d, 17a-b, 18, 19, 20a-b, 21-30) appearing as ABU52578-ABU52624), a
CC variant of NOVX, a mature form of NOVX, and a variant of the mature form
CC of NOVX. Also included are a nucleic acid molecule (NOVX NA) encoding
CC NOVX, or a fragment or complement of NOVX NA, a vector comprising NOVX
CC NA, a cell comprising the vector, an anti-NOVX antibody (ab), determining
CC the presence or amount of NOVX or NOVX NA in a sample, and identifying an
CC agent that binds or modulates the expression or activity of NOVX. NOVX,
CC NOVX NA or ab is useful for treating or preventing a NOVX-associated
CC disorder in a subject, preferably human. Ab is useful for determining the
CC presence or amount of NOVX in a sample. NOVX is useful for identifying an
CC agent that binds to NOVX . NOVX, NOVX NA or ab is useful for treating
CC metabolic disorders, diabetes, cardiomyopathy, obesity, infectious
CC disease, anorexia, neurodegenerative disorders, Alzheimer's disease,
CC Parkinson's disease, immune disorders, haematopoietic disorders, and
CC various dyslipidaemias, metabolic disturbances associated with obesity,
CC the metabolic syndrome X and wasting disorders associated with chronic
CC diseases, various cancers, endocrine, connective tissue, blood, vascular,
CC skin, renal, bone, brain, muscle disorders, or bacterial, fungal,
CC protozoal or viral infections. NOVX, NOVX NA or ab is useful in screening
CC assays, detection assays, predictive medicine, and in methods of
CC treatment. NOVX is useful as immunogen, to screen for potential
CC ant/agonist compounds, and as bait protein in a two-hybrid or three-
CC hybrid assay. NOVX NA is useful in gene therapy, to express NOVX, to
CC detect NOVX mRNA or a genetic lesion in a NOVX gene, and to modulate NOVX
CC activity. The cell is useful for producing non-human transgenic animals.
CC Ab is useful for isolating, and purifying NOVX and to monitor protein
CC levels in tissue as part of a clinical testing procedure. The present
CC sequence is a real-time quantitative (RTQ)-PCR primer used to assay
CC tissue specific expression of mRNA encoding a NOVX protein

PT Detecting the presence or diagnosing the risk of cancer or benign tumor,
PT e.g. an ovarian, endometrial or prostate cancer, by determining the
PT presence of or detecting aberrant expression of KLK4 in a biological
PT sample from the patient.
XX
PS Example 2; Page 67; 126pp; English.
XX
CC The present invention describes a method (M1) for detecting the presence
CC or diagnosing the risk of cancer or benign tumour in a patient. M1
CC comprises determining the presence of or detecting aberrant expression of
CC KLK4 in a biological sample obtained from the patient. KLK4 has
CC cytostatic activity. The method is useful for detecting the presence or
CC diagnosing the risk of a cancer or a benign tumour in a patient,
CC particularly an ovarian, endometrial or prostate cancer, or a cancer or
CC benign tumour associated with an organ or tissue from the ovaries,
CC endometrium or prostate. An agent which can be used for restoring or
CC modulating KLK4 expression can be used for treating or preventing cancer
CC or benign tumour. KLK4 polynucleotides, polypeptides or antigen-binding
CC molecules from the present invention can be used for detecting aberrant
CC KLK4 polynucleotides or aberrant K4 polypeptides that correlate with a
CC cancer or a benign tumour. The present sequence represents a PCR primer
CC for beta-2-microglobulin, which is used in an example from the present
CC invention

XX
CC   The present invention relates to a composition comprising an
CC   oligonucleotide having at least one 2'-O-methyl nucleotide, in which the
CC   oligonucleotide is complementary to nucleotides of a genomic RNA strand,
CC   a terminus of the oligonucleotide being attached to a linker, and an
CC   activator of RNase L attached to the linker. Also described is a method
CC   of identifying respiratory syncytial virus (RSV) infection in a mammalian
CC   cell. The methods and compositions are useful for inhibiting infection by
CC   RNA viruses with complexes of an activator of RNase L, such as
CC   respiratory syncytial virus. The present sequence is an RSV antisense RNA
CC   used in the exemplification of the invention

PT Preparing a DNA molecule, useful in genomics, molecular biology and
PT sequencing, comprises attaching a primer having substantially known
PT sequence to at least one end of DNA fragments.
XX
PS Example 2; Page 42; 120pp; English.
XX
CC This invention relates to a novel method for preparing DNA molecules that
CC are useful in genomics, molecular biology and particularly for sequencing
CC purposes. Specifically, the invention describes preparing DNA fragments
CC from the random fragmentation of a parent DNA molecule, attaching a
CC primer to at least one end of each fragment to produce primer linked
CC fragments such that this plurality can be amplified as a whole.
CC Accordingly, this method prepares DNA templates that provide more
CC efficient sequencing for difficult DNA molecules, higher sequence quality
CC and longer reads. Furthermore, applications of this method include
CC conditioning the 3' end or providing 3' exonuclease activity to the end
CC of a DNA molecule, detecting a damaged DNA molecule and repairing the 3'
CC end, and preparing a DNA probe. This oligonucleotide sequence is the S36
CC primer used for positional amplification and sequencing of an Escherichia
CC coli (E. coli) genomic region. Specifically, the S36 primer is used in
CC the primary amplification of contig 13 of the E. coli genome, a method of
CC the invention

PT genetic and/or therapeutic tools for interfering or inhibiting expression
PT of a target gene.
XX
PS Claim 71; SEQ ID NO 194; 176pp; English.
XX
CC The present invention describes an RNA (I) used for the interference or
CC inhibition of expression of a target gene, where (I) comprises double
CC stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang
CC having a length of 0-nucleotide to 5-nucleotides on each strand, where
CC the sequence of the double stranded RNA is substantially identical to a
CC portion of a mRNA or transcript of the target gene. Also described: (1)
CC interfering with or inhibiting the expression of a target gene in a cell
CC by exposing the cell to an amount of (I); (2) a gene silencing array
CC comprising a substantially flat substrate, and addressably arrayed
CC different double-stranded RNAs; (3) an array-based method of assessing a
CC phenotypic effect of a double-stranded RNA on a target gene; (4)
CC validating a gene as a potential drug target for a disease or condition;
CC (5) selecting an optimised sequence of a double-stranded RNA for
CC interference with or inhibition of expression of a target gene in a cell;
CC and (6) a short double-stranded RNA effective for interfering with or
CC inhibiting expression of a target gene comprising any of 311 20-78
CC nucleotide sequences (see ADC16276 to ADC16586). (I) has cytostatic
CC activity, and can be used in gene therapy. The RNAs are useful as reverse
CC genetic and/or therapeutic tools for interfering or inhibiting expression
CC of a target gene. They are useful for treating proliferative diseases,
CC e.g. cancer.

PT Direct comparison of numerical gene expression values between samples of
PT genes comprises using multiplex standardized reverse transcription-
PT polymerase chain reaction.
XX
PS Example 1; SEQ ID NO 265; 59pp; English.
XX
CC The present invention relates to a method for the direct comparison of
CC numerical gene expression values between samples of genes. The method
CC comprises amplifying cDNA in the presence of a competitive template
CC mixture and primer pairs for several genes and then amplifying aliquots
CC of the PCR products using a primer pair specific for each gene. The
CC method of amplification is by multiplex standardised reverse
CC transcriptase-polymerase chain reaction (StaRT-PCR). High density
CC oligonucleotide or cDNA arrays are used to measure PCR products following
CC quantitative StaRT-PCR. The method is useful for the assessment of gene
CC expression in small biological samples such as fine needle aspirate
CC biopsies, and laser captured microdissected materials. The method allows
CC for the standardised measurement of hundreds of genes from the same
CC sample, which in prior art, could only be assessed for one gene. The
CC present sequence represents a multiplex StaRT-PCR primer which can be
CC used in the method of the present invention.

PT   New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and
PT   selective cytotoxic effect on tumour cells, for treating both solid and
PT   liquid tumours.
XX
PS   Claim 10; Page 5; 38pp; English.
XX
CC   Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 79%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PT   respiratory system, suitable for long term treatment of asthma, adult
PT   respiratory distress syndrome etc.
XX
PS   Claim 13; Page 24; 47pp; English.
XX
CC   Sequences AAV47447-V47451 are anti-sense oligonucleotides that target the
CC   human adenosine A2b receptor, the design of which required the secondary
CC   structure of this targets mRNA. The adenosine receptor mRNA secondary
CC   structure was both analysed and used to construct antisense
CC   oligonucleotides containing a phosphorothioate backbone. Once the
CC   antisense molecules are created they can be used to target their
CC   predetermined target, thus causing the gene product to decrease. The
CC   antisense oligonucleotides were targeted to specific mRNA regions
CC   containing either a junction between the intron and exon, or where they
CC   may overlap the initiation codon. The receptor is a member of the G-
CC   protein coupled family of cell surface receptors that have 7-
CC   transmembrane segments. These oligonucleotides can be used to treat or
CC   prevent conditions associated with bronchoconstriction and/or lung
CC   inflammation in humans or other animals e.g. asthma, pulmonary disease,
CC   allergy, emphysema and cystic fibrosis

PT Assay of genetic sequences based on triplex formation from double
PT stranded analyte - and hybrid of anchor and reporter sequences, with
PT reporter released if triplex formation occurs, used e.g. to identify
PT bacteria.
XX
PS Disclosure; Col 15-16; 168pp; English.
XX
CC The present sequence represents a potential triple-helix forming region.
CC It can be used to demonstrate the assay of the invention. The assay
CC comprises adding a sample containing double-stranded DNA test sequences,
CC e.g. containing the present sequence, to an aqueous medium containing at
CC least one complex of anchor DNA, attached to a solid support, and
CC reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC designed to form a triple-strand structure with part of the test
CC sequence. Triplex formation results in displacement of the reporter DNA
CC which is detected as an indication of the presence of the DNA test
CC sequence. The method is used to detect DNA sequences, particularly for
CC identification of bacteria (by detecting genes for ribosomal RNA) in
CC clinical samples, but also detection of oncogenes and Hepatitis B virus

PT Detecting thyroid epithelial cells in blood - by detecting cDNA from
PT thyroid-specific RNA, particularly for monitoring treatment and recovery
PT from thyroid cancer following thyroidectomy.
XX
PS Claim 29; Page 63; 80pp; English.
XX
CC AAV74143-V74155 are PCR primers and probes used to detect thyroid
CC epithelial cells (TEC) in a patient. The detection method comprises
CC detecting a transcript of a thyroid-specific gene in a sample of reverse-
CC transcribed total RNA of blood cells. The specification also describes a
CC method for detecting TEC by polymerase chain reaction (PCR) of reverse-
CC transcribed RNA (not necessarily total RNA) from blood cells, using
CC primers that produce an amplicon that spans at least one intron, then
CC detecting the PCR product and also a method for monitoring recurrence of
CC thyroid cancer in a recovering patient by detecting, in a sample of
CC reverse-transcribed total RNA of blood cells, a transcript of a thyroid-
CC specific gene as an indicator of recurrence. The specification also
CC describes a method for detecting TEC by cell-sorting to isolate a TEC-
CC containing fraction from blood, then detecting TEC in this fraction. The
CC methods are used to monitor treatment of, and recovery from, thyroid
CC cancer, in patients who have had a total thyroidectomy. The method does
CC not require the patient to stop thyroid hormone replacement therapy and
CC is not subject to interference from antibodies against thyroglobulin
CC which may falsify the conventional immunoassay. Peripheral blood is an
CC easily obtained source of sample and the process is more sensitive than
CC immunoassay. By amplifying fragments from several thyroid specific genes,
CC even rare forms of thyroid cancer may be diagnosed

PT Isolating microsatellites from Myrtaceae, useful for genotyping,
PT particularly in breeding programs for tea tree, by reacting plant nucleic

```
PT   acid with immobilized oligonucleotides.
XX
PS   Claim 10; Page 37; 100pp; English.
XX
CC   A method has been developed of isolating a microsatellite (MS) from
CC   nucleic acid extract of a plant of Myrtaceae family. The method
CC   comprises: (i) treating the extract with one or more immobilised, single-
CC   stranded oligonucleotides (ON) having a consensus MS repeat sequence
CC   (MSRS) or its complement; (ii) washing under specified stringency
CC   conditions; (iii) eluting nucleic acid bound to ON; and (iv) sequencing
CC   the eluted nucleic acids to identify those containing an MSRS.
CC   Microsatellites (MS) isolated by the method, specifically from Melaleuca
CC   alternifolia (the tea tree, a source of a broad-spectrum germicidal oil,
CC   useful in pharmaceuticals and cosmetics), are useful as genotyping
CC   markers, particularly for breeding plants that produce the oil in higher
CC   yield or of better quality. Primers based on MS are useful for both inter
CC   - and intra-species genotyping. The selected washing conditions improve
CC   efficiency of recovery of microsatellites (MS) and reduce the number of
CC   washing stages required. Particularly about 86% of recovered sequence
CC   contain an MS repeat sequence, compared with 50-70% when the conventional
CC   washing procedure is followed. AAA35313 to AAA35357, and AAA35562 to
CC   AAA35575 represent nucleotide sequences from the present invention which
CC   contain microsatellite sequences. AAA35358 to AAA35561 represent
CC   oligonucleotide PCR primers used for identifying Myrtaceae microsatellite
CC   sequences. (Updated on 06-AUG-2003 to correct OS field.)

PT Modifying antibody half life by linking the antibody to an FcRn binding
PT domain.
XX
PS Example 3; Fig 2; 79pp; English.
XX
CC The invention relates to modification of the half-life of an antibody.
CC The method of the invention comprises physically linking an antibody
CC which contains an FcRn receptor binding moiety (hinge, CH2 and CH3
CC domains) to a second FcRn binding moiety. IgG (immunoglobulin G)
CC molecules are protected from degradation by the endosomal FcRb/FcRn
CC receptors, which gives them a relatively extended serum half-life
CC relative to other serum proteins. The presence of a second FcRn binding
CC moiety further extends the serum half-life of an antibody. By increasing
CC the serum half life of an antibody, the amount of antibody needed in
CC clinical treatments is lowered. This could significantly lower costs for
CC treatment, and lead to less frequent hospital visits as fewer doses are
CC required, thereby increasing the quality of life for patients, and
CC potentially reducing the likelihood of toxicity. The technology can also
CC be adapted to extend the serum half life of other proteins, in addition
CC to antibodies. Sequences AAA06866-A06867 represent PCR primers used to
CC introduce a a Bsu36I restriction site into DNA encoding the last 4 amino
CC acids of the human IgG4 constant region. This restriction site was then
CC used for the insertion of DNA encoding human IgG1 hinge, CH2 and CH3
CC domains, generating a construct encoding a human IgG4 fused via the CH3
CC domain to a human IgG1 FcRn receptor binding moiety

PT New radiation hybrid map of the dog, Canine familiaris, genome, useful
PT for e.g. identifying genes implicated in phenotypic and behavioral traits
PT or in genetic diseases and for studying dog pedigrees.
XX
PS Claim 1; Page 87; 87pp; English.
XX
CC The present invention describes a radiation hybrid map of the dog (Canine
CC familiaris) genome comprising the genome location of a marker selected
CC from AAA66139 to AAA66942. The radiation hybrid map is useful for
CC identifying and localising dog genes, since it covers approximately 80 %
CC of the dog genome and provides a dense map integrating different types
CC (i.e. Type I and Type II) of markers. The map and the dog genome markers
CC (or complementary sequences) are especially useful to identify genes
CC responsible for phenotypic and behavioural traits in dogs, to identify
CC morbid genes, to analyse diseases and identify implicated genes in such
CC diseases and their alleles, and to study dog pedigrees. They may also be
CC useful for isolating corresponding human gene sequences e.g. genes
CC involved in genetic diseases

PT Differentially expressed genes involved in angiogenesis, useful for
PT treating e.g. vascular tumors, atherosclerosis and/or restenosis
PT subsequent to balloon angioplasty.
XX
PS Example 19; Page 148; 182pp; English.
XX
CC The present invention describes differentially expressed genes involved
CC in angiogenesis (I), and the polypeptides that encode them. (I) have
CC cardiovascular activity, and can be used in the modulation of
CC angiogenesis. The nucleic acids and polypeptides may be used in the
CC prevention, diagnosis and treatment of diseases associated with
CC inappropriate angiogenesis. The polypeptides may also be used as antigens
CC in the production of antibodies against them and in assays to identify
CC modulators of their expression and activity. The antibodies and
CC antagonists may also be used to down regulate expression and activity and
CC modulate angiogenesis. The antibodies may also be used as diagnostic
CC agents for detecting the presence of the polypeptides in samples.
CC Disorders that may be prevented, diagnosed and/or treated by the above
CC methods include, for example vascular tumours, proliferative tumours,
CC proliferative vitreoretinopathy, rheumatoid arthritis, Crohn's disease,
CC atherosclerosis, ovarian hyperstimulation, psoriasis, endometriosis
CC associated with neovascularisation, restenosis subsequent to balloon
CC angioplasty, scar tissue over production. peripheral vascular disease,
CC hypertension, inflammatory vasculitides, Reynaud's disease and Reynaud's
CC phenomenon, aneurysms, arterial restenosis, thrombophlebitis,
CC lymphangitis, lymphedema, wound healing and tissue repair, ischaemia
CC reperfusion injury, angina, myocardial infarctions, chronic heart
CC conditions, heart failure such as congestive heart failure, age-related
CC macular degeneration and osteoporosis. AAH22255 to AAH22325 and AAB98322
CC to AAB98325 represent sequence used in the exemplification of the present
CC invention

PT New nucleic acid construct comprising suppressor of cytokine signaling-3
PT promoter useful in gene therapy for treating growth retardation or
PT acceleration disorder, (auto)immune diseases, or inflammatory conditions.
XX
PS Example 1; Page 22; 64pp; English.
XX
CC The sequences given in AAC85376-77 and AAC85379-80 are primers which were
CC used to mutate the murine suppressor of cytokine signalling (SOCS)-3
CC promoter around the STAT binding elements. The murine SOCS-3 gene
CC promoter contains a pair of STAT binding elements TTNNNNNAA, separated by
CC 14 nucleotides, making it structurally similar to the human CIS gene
CC promoter. However only the STAT-binding element at -74 to -66 is
CC essential for optimal operability. The SOCS-3 promoter or the operative
CC fragments of it, are useful for treating growth retardation or
CC acceleration disorder, autoimmune diseases, immune diseases and
CC inflammatory conditions, including Crohn's disease, ulcerative colitis,
CC multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis,
CC Grave's disease, allergic or anaphylactic reaction, or
CC neuroendocrinological response to stress. The promoter sequence can be
CC used to correct clinical disorders derived from defective negative
CC regulation of cytokine signal transduction in GH-responsive or gp-
CC responsive cells

PT synthesis.
XX

```
PS   Example 1; Col 63-64; 38pp; English.
XX
CC   The invention relates to a znssp2 polypeptide, a novel member of the
CC   galactosyltransferase family. The znssp2 is a homologue of beta-1,3-
CC   galactosyltransferase and can be expressed by standard recombinant
CC   methodology. The znssp2 polypeptide is useful to study pancreatic cell
CC   proliferation or differentiation. The znssp2 polynucleotide is useful for
CC   regulating the maturation of UDP-glycosyltransferase substrate-bearing
CC   cells, such as fibroblasts, lymphocytes and haematopoietic cells, for
CC   treating disorder associated with cell migration, contact inhibition,
CC   tissue interaction, neuronal specificity, fertilization, embryonic cell
CC   adhesions, limp bud morphogenesis, mesenchyme development, immune
CC   recognition, inflammation, tumourigenesis, growth control, tumour
CC   metastasis and intracellular and extracellular glycoprotein and
CC   glycolipid biosynthesis. It is also useful in diagnostic applications,
CC   chromosomal identification and/or mapping. Znssp2 gene is useful as probe
CC   to identify humans having a defective pancreatic or colonic specific
CC   beta,1,3, galactosyltransferase gene and as indicators of pancreatic and
CC   colonic cancer and disease. Znssp2 polypeptide and polynucleotide are
CC   useful in the treatment of disorders associated with pancreas, diabetes,
CC   hypoglycemia, digestive systems including pancreas, colon and small
CC   intestine, neuronal tissues, bone marrow and peripheral leukocytes, and
CC   in disorders associated with glycoprotein synthesis. The present sequence
CC   represents a human znssp2 cDNA amplifying primer

```

CC The invention relates to constructing (M1) a strain of diploid fungal
CC cells in which both alleles of a gene are modified, comprising modifying
CC one allele by insertion or replacement by a cassette having an
CC expressible selectable marker and modifying other allele by
CC recombination, of a promoter replacement fragment with a heterologous
CC promoter, so that expression of the second allele is regulated by the
CC promoter. (M1) is useful for constructing a strain of diploid fungal
CC cells in which both alleles of a gene are modified. The diploid fungal
CC cells having both alleles modified are useful for identifying a gene that
CC is essential to the survival or growth of a fungus, a gene that
CC contributes to the virulence and/or pathogenicity of a fungus, a gene
CC that contributes to the resistance of a diploid fungus to an antifungal
CC agent, an antifungal agent that inhibits the growth of a diploid fungus
CC and for identifying a therapeutic agent for treatment of a mammalian
CC disease. (M1) is useful for identifying a compound which modulates the
CC activity of a gene product, preferably enzymatic activity, carbon
CC compound catabolism, biosynthetic, transporter, transcriptional,
CC translational, signal transduction, DNA replication and cell division
CC activity. The method is useful for identifying a compound having the
CC ability to inhibit growth or proliferation of C. albicans cells and for
CC treating infection by C. albicans. The present sequence is that of a PCR
CC primer used in the method of the invention. Note: The sequence data for
CC this patent is not represented in the printed specification but is based
CC on sequence information supplied to Derwent by the European Patent Office

PT Novel nucleic acid encoding replication competent recombinant hepatitis C
PT virus genome useful for screening anti-hepatitis C virus therapeutics and
PT for vaccine development.
XX
PS Example 1; Page 75; 85pp; English.
XX
CC The present invention provides protein and coding sequences from
CC Hepatitis C virus (HCV), comprising all or part of the HCV genome and
CC able to replicate efficiently when transfected into a susceptible cell
CC line without reducing the growth rate of the cell line by more than 10
CC fold. The sequences are useful for screening for anti-HCV therapeutics,
CC for detecting antibodies to HCV in a biological sample such as blood,
CC serum, plasma, blood cells, lymphocytes, or liver cells from a subject,
CC for deriving authentic HCV components such as replication-complement non-
CC infectious, replication-defective infection-component, and replication-
CC defective non-infectious HCV, in gene therapy or gene vaccination
CC targeted to hepatic tissue for treating an animal infected or susceptible
CC to HCV infection and for studying HCV infection and propagation. The
CC present sequence is a PCR primer used to amplify the HCV NS5B region in
CC the exemplification of the invention

PT   Determining the racing potential of a horse comprises measuring whether
PT   grandpaternal or grandmaternal DNA from the selected grandmother DNA is
PT   over-represented in the genome of the horse.
XX
PS   Example 2; Page 25; 49pp; English.
XX
CC   The invention relates to a novel method for determining racing potential
CC   of a horse. The method comprises measuring: whether grandpaternal DNA is
CC   over-represented in the genome of the horse; or in the case where one of
CC   the grandmothers was selected for breeding on the basis of racing
CC   performance, whether grandmaternal DNA from the selected grandmother is
CC   over-represented in the genome of the horse which indicates that the
CC   horse has good racing potential. The method of the invention is useful
CC   for determining the racing potential of a horse or for obtaining a
CC   progeny horse with good racing potential. This polynucleotide sequence
CC   represents a PCR primer used in the detection method of over-
CC   representation of DNA from male grandparents of the invention

PT   New diagnostic composition comprising at least one nucleic acid molecule
PT   that is capable of specifically hybridizing to the mRNA of the gene,
PT   useful for diagnosing cardiopathy, e.g. cardiomyopathy or dilated
PT   cardiomyopathy.
XX
PS   Example 1; Page 22; 82pp; English.
XX
CC   The invention relates to a diagnostic composition comprising at least one
CC   nucleic acid molecule listed in the specification that is capable of
CC   specifically hybridizing to the mRNA of at least one of the genes given
CC   in the specification. The diagnostic composition and nucleic acid
CC   molecules are useful for diagnosing cardiopathy or a disposition to
CC   cardiopathy, e.g. cardiomyopathy or dilated cardiomyopathy. The method
CC   involves contacting a target sample with the nucleic acid molecule cited
CC   above, and comparing the concentration of the individual mRNA(s) with the
CC   concentration of the corresponding mRNAs from at least one of the healthy
CC   donor. The nucleic acids are also useful for the isolation and
CC   development of a compound useful for therapy or prevention of a
CC   cardiopathy. Sequences ACC78653-700 represent primers used in real-time
CC   quantitative PCR for amplifying human genes, during the course of the
CC   invention

PT New CYP1A2 polynucleotide and polypeptide, useful for the preparation of
PT a diagnostic or therapeutic composition for cancer, congenital jaundice,
PT porphyria cutanea tarda or tardive dyskinesia in schizophrenia.
XX
PS Example 1; Page 38; 117pp; English.
XX
CC The invention relates to a novel polynucleotide comprising any of 37 11-
CC 761 base pair sequences, given in the specification, encoding a
CC polypeptide with any of 4 28-31 residue amino acid sequences, in the
CC specification, hybridising to a CYP1A2 gene, or encoding a CYP1A2
CC polypeptide or fragment comprising an amino acid substitution at position
CC 61, 298, 401 or 438. A polypeptide of the invention has cytostatic,
CC hepatotropic, dermatological, and cerebroprotective activity. A
CC polynucleotide of the invention may act as a CYP1A2-antagonist or CPY1A2-
CC agonist, and may have a use in gene therapy. The methods and compositions
CC of the present invention are useful for the preparation of a diagnostic
CC or therapeutic composition for a disease, in particular cancer,
CC congenital jaundice, porphyria cutanea tarda or tardive dyskinesia in
CC schizophrenia. The sequences shown in ACC90635-ACC90686 represent PCR
CC primer used in the invention to screen for polymorphisms within CYP1A2

PS Example C; Page 332; 849pp; English.
XX
CC The invention relates to an isolated polypeptide comprising one of 127
CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature
CC form of NOVX, an amino acid sequence which is at least 95% identical to
CC NOVX or an amino acid sequence comprising one or more conservative
CC substitutions in NOVX. Also included are nucleic acids encoding NOVX
CC proteins, determining the presence or amount of NOVX or NOVX DNA in a
CC sample (by introducing the sample to an antibody that binds
CC immunospecifically to the polypeptide, and determining the presence or
CC amount of antibody bound to the polypeptide), determining the presence of
CC or predisposition to a disease associated with altered levels of
CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying
CC an agent that binds to NOVX, identifying a potential therapeutic agent
CC for treatment of a pathology related to aberrant expression or aberrant
CC physiological interactions of NOVX, screening for a modulator of activity
CC of or of latency or predisposition to a pathology associated with NOVX, a
CC vector comprising NOVX DNA, a cell comprising the vector (used to produce
CC NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides
CC are useful as a marker for cell or tissue type, and in diagnosing and
CC treating pathologies, diseases, conditions or disorders associated with
CC NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension,
CC congenital heart defects, prostate cancer, diabetes, metabolic disorders,
CC neoplasm, graft versus host disease, AIDS, bronchial asthma, Crohn's
CC disease, multiple sclerosis, infectious diseases, anorexia, cancer-
CC associated cachexia, neurodegenerative disorders (e.g. Alzheimer's
CC disease or Parkinson's disease), immune disorders, haematopoietic
CC disorders, dyslipidaemias, and wasting disorders associated with chronic
CC diseases. These may also be used to screen for molecules which inhibit or
CC enhance NOVX activity or function, and for detecting specific cell types.
CC These may also be used in chromosome mapping, gene therapy, tissue

```
CC   typing, and in forensic biology. The present sequence is a reverse
CC   transcriptase (RT)-PCR primer used to assess the tissue specific
CC   expression of mRNA encoding a NOVX protein

PT   New transgenic mammal (e.g. goat) expressing a butyrylcholinesterase
PT   (BChE) enzyme in its milk or urine, useful for large-scale production of
PT   recombinant BChE to prevent or treat organophosphate poisoning or cocaine
PT   intoxication.
XX
PS   Example 1; Page 41; 112pp; English.
XX
CC   The present sequence is that of sense primer Acb710, which was used in
CC   the PCR amplification of human butyrylcholinesterase (BChE) cDNA (see
CC   ACC84169) from pCMV/BChE. The PCR product was used in the construction of
CC   pCMV/BChE/hSA, used to prepare a BChE-hSA fusion protein in mammalian
CC   cells. The primer was also used to generate a probe for detection of a
CC   BChE transgene. The invention provides methods for large-scale production
CC   of recombinant BChE in cell culture, and in the milk and/or urine of
CC   transgenic mammals. The recombinant BChE can be used in preventing and/or
CC   treating organophosphate pesticide poisoning, nerve gas poisoning,
CC   cocaine intoxication or succinylcholine-induced apnoea

XX
PT   Novel isolated nucleic acid molecule comprising single nucleotide
PT   polymorphism associated with fish, useful for forming PCR primers which
PT   are used for detecting single nucleotide polymorphisms in fish nucleic
PT   acids.
XX
PS   Claim 1; SEQ ID NO 4; 233pp; English.
XX
CC   The present invention describes an isolated nucleic acid (I) comprising a
CC   single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC   Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC   and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC   (i), or its complement under highly stringent hybridisation conditions.
CC   Also described: (1) an isolated oligonucleotide (II) comprising at least
CC   17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC   a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC   of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC   origin of fish sample comprising providing a parentage genotype database
CC   comprising a collection of candidate parent genotypes, where each of the
CC   candidate parent genotype represents a distinct origin, and comparing a
CC   sample genotype to the parentage genotype database, where a match between
CC   the sample genotype and one of the candidate parent genotype identifies
CC   to the origin of the sample. (M1) is useful for determining the origin of
CC   a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC   rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC   detecting nucleic acid molecule comprising SNP in a sample, which
CC   involves contacting the sample containing nucleic acids with one or more
CC   (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC   SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC   useful for detecting nucleic acid molecule comprising a polymorphic
CC   sequence in a sample, comprising contacting the sample containing nucleic
CC   acids with one or more (II) which is derived from O. niloticus
CC   microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC   sites or seabass polymorphic sites, and identifying a nucleic acid that
CC   hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC   comprising a microsatellite sequence in sample. The present sequence is
CC   used in the exemplification of the present invention.

CC   This 5' primer was used with a 3' primer (see AAV07975) in the PCR
CC   amplification of Helicobacter pylori strain ORV2001 genomic DNA in order
CC   to obtain DNA (see AAV07917) encoding a 76 kDa polypeptide (see AAW73028)
CC   designated GHPO 711. The primer pair includes a 5' clamp and BamHI and
CC   XhoI restriction enzyme reocgnition sequences for cloning purposes. The
CC   PCR product was ligated into vector pET28a, and recombinant polypeptide
CC   was expressed as a histidine-tagged fusion protein in E. coli host cells.
CC   The polypeptide can be used to develop vaccines for the treatment and
CC   prevention of Helicobacter infections. (Updated on 25-MAR-2003 to correct
CC   PI field.)

PT   Selecting gene switches useful for regulating transcription of a DNA
PT   sequence comprises complexing target DNA with DNA binding molecule in the
PT   presence and absence of DNA binding ligand, and comparing the binding.
XX
PS   Example 1; Page 70; 106pp; English.
XX
CC   The present invention relates to selecting a gene switch with a target
CC   DNA molecule, a DNA binding molecule which binds to the target such that
CC   it may be modulated by a DNA binding ligand. The invention is useful for
CC   regulating transcription from a DNA sequence. The ligand is useful for
CC   modulating the expression of one or more nucleotide sequences of interest
CC   in a host cell, preferably a plant cell

PT   Selecting switching system components comprising first molecule, second
PT   molecule and ligand, involves determining degree of binding between the
PT   molecules in the presence and absence of the ligand.
XX
PS   Example 1.1; Page 138; 193pp; English.
XX
CC   The invention relates to a method of selecting components of a switching
CC   system comprising first molecule (M1), selecting (I) a ligand (L2) which
CC   is capable of modulating the interaction between a nucleic acid binding
CC   molecule (NBM) and a target nucleic acid (TN). NBM, TN and the ligands
CC   are useful for regulating a biological process selected from sub-cellular
CC   trafficking and signal transduction, and for regulating transcription or
CC   translation from a nucleic acid sequence comprising TN to which NBM binds
CC   in a manner modulatable by the ligand. They are also useful for
CC   modulating a biological process affecting one or more genes, such as in
CC   transcription, translation, phosphorylation, replication, transport,
CC   splicing, integration and recombination, in a host cell. The polypeptides
CC   or ligands selected from (S) are useful for regulating a biological
CC   process involving binding of first polypeptide with second polypeptide,
CC   selected from sub-cellular trafficking and signal transduction. (I) is
CC   also useful for screening any or all the components of the gene switch
CC   system or protein switch system, and for modulating the interaction
CC   between the components of the switching system. The binding molecules are
CC   useful as diagnostic and research tools, and for switching or modulating
CC   gene expression, especially in gene therapy applications and agricultural
CC   technology applications. The ligands are also useful in the treatment of
CC   diseases. Multiple target nucleic acids or polypeptides could be used in
CC   a single selective step, thus enabling multiple nucleic acid or
CC   polypeptide binding molecules to be isolated simultaneously, even in the
CC   same physical vessel. The present sequence represents the selection
CC   target #2 used to screen a phage library comprising variants of the
CC   middle finger from the DNA binding domain of Zif268, used in the method
CC   of the invention

PT   Selecting switching system components comprising first molecule, second
PT   molecule and ligand, involves determining degree of binding between the
PT   molecules in the presence and absence of the ligand.
XX
PS   Example 3; Page 146; 193pp; English.
XX
CC   The invention relates to a method of selecting components of a switching
CC   system comprising first molecule (M1), selecting (I) a ligand (L2) which
CC   is capable of modulating the interaction between a nucleic acid binding
CC   molecule (NBM) and a target nucleic acid (TN). NBM, TN and the ligands
CC   are useful for regulating a biological process selected from sub-cellular
CC   trafficking and signal transduction, and for regulating transcription or
CC   translation from a nucleic acid sequence comprising TN to which NBM binds
CC   in a manner modulatable by the ligand. They are also useful for
CC   modulating a biological process affecting one or more genes, such as in
CC   transcription, translation, phosphorylation, replication, transport,
CC   splicing, integration and recombination, in a host cell. The polypeptides
CC   or ligands selected from (S) are useful for regulating a biological
CC   process involving binding of first polypeptide with second polypeptide,
CC   selected from sub-cellular trafficking and signal transduction. (I) is
CC   also useful for screening any or all the components of the gene switch
CC   system or protein switch system, and for modulating the interaction
CC   between the components of the switching system. The binding molecules are
CC   useful as diagnostic and research tools, and for switching or modulating
CC   gene expression, especially in gene therapy applications and agricultural
CC   technology applications. The ligands are also useful in the treatment of
CC   diseases. Multiple target nucleic acids or polypeptides could be used in
CC   a single selective step, thus enabling multiple nucleic acid or
CC   polypeptide binding molecules to be isolated simultaneously, even in the
CC   same physical vessel. The present sequence represents the selection
CC   oligonucleotide #2 used to mutate the zinc finger DNA binding domain used
CC   in the method of the invention

PT   Selecting gene or protein switches for use in modulating gene expression,
PT   comprises selecting complexes of two molecules and a ligand whose binding
PT   differs in the presence or absence of the ligand.
XX
PS   Example 3; Page 93; 125pp; English.
XX
CC   The present sequence is that of the DNA recognition sequence of a novel
CC   DNA ligand modulatable restriction enzyme. Phage-selected or rationally
CC   designed zinc finger domains which bind target DNA sequences in a manner
CC   modulatable by a ligand can be converted to restriction enzymes which
CC   cleave DNA containing the target sequence in a manner modulatable by the
CC   ligand. This is achieved by coupling a zinc finger to a cleavage domain
CC   of a restriction enzyme or other nucleic acid cleaving moiety. In this
CC   case, a fusion was made between the catalytic domain of FokI and a zinc
CC   finger. Fusion of the zinc finger nucleic acid-binding domain to the FokI
CC   restriction enzyme resulted in a novel endonuclease which cleaved DNA
CC   adjacent to the present DNA recognition sequence. The DNA-ligand
CC   modulatable restriction enzyme can be used in novel molecular switches of
CC   the invention that are used to modulate gene expression e.g. in gene
CC   therapy or in transgenic plants

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 30; 62pp; English.
XX
CC   The present sequence is that of a single mismatch target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Experiments with the present
CC   sequence and a perfectly-matched target (see ABL57071) showed that
CC   hybridisation was very specific to the matched target. The invention
CC   relates generally to the use of metal surface quenchers such as particles
CC   or films for high sensitivity applications in, for example, detection and
CC   diagnostic systems

PT   Novel human cervical cancer 2 protooncogene protein and polynucleotide
PT   encoding it useful for diagnosing various cancers e.g. leukemia, lymphoma
PT   or uterine cervix cancer, and for producing transformed animals.
XX
PS   Disclosure; Page 47; 49pp; English.
XX
CC   The invention discloses a human cervical cancer 2 (HCCR-2) protooncogene
CC   and encoded protein. The protooncogene was discovered using mRNA
CC   differential display, identifying it as being amplified in cancer cells
CC   and, more specifically, involved in the tumourigenesis of cervical
CC   cancer. HCCR-2 is useful for preventing, diagnosing or treating cancer,
CC   including leukaemia, lymphoma, colon, breast, kidney, stomach, lung,
CC   ovary or uterine cervix cancer. HCCR-2 is also useful for producing
CC   antibodies which are useful as diagnostic tools. HCCR-2 protooncogene is
CC   useful in the diagnosis of various cancers, in antisense gene therapy and
CC   for producing transformed animals which are useful in screening for
CC   carcinogens or anticancer agents, such as antioxidants. The protooncogene
CC   is also useful for establishing a continuous viable cancer cell line
CC   which is useful in searching for anticancer agents. The sequence
CC   presented is the anchored oligo-dT primer, H-T11G, which was used to
CC   amplify cDNA for differential display. This technique identified a cDNA
CC   fragment, designated CC214, which was then used as a probe to isolate the
CC   full length cDNA (cervical cancer 2 (HCCR-2) protooncogene) from a human
CC   lung embryonic fibroblast cDNA library

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

XX

```
CC   The present invention describes enzymatic nucleic acid molecules (NAMs)
CC   which specifically cleave RNA derived from an epidermal growth factor
CC   receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090
CC   represent specifically claimed target sequence from human EGF-R. AAV98044
CC   to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and
CC   hairpin ribozymes respectively for human EGF-R. The NAMs are useful for
CC   cleaving EGF-R RNA in the treatment of a condition associated with EGFR
CC   expression levels e.g. to inhibit cell proliferation in the prevention or
CC   treatment of cancers. The NAMs can also be used as diagnostic tools to
CC   examine genetic drift and mutations within diseased cells or to detect
CC   the presence of EGF-R RNA in a cell

PT   Assay of genetic sequences based on triplex formation from double
PT   stranded analyte - and hybrid of anchor and reporter sequences, with
PT   reporter released if triplex formation occurs, used e.g. to identify
PT   bacteria.
XX
PS   Disclosure; Col 15-16; 168pp; English.
XX
CC   The present sequence represents a polynucleotide that is able to form a
CC   triple helix with a double stranded sequence. Cytosine bases in the
CC   present can be replaced with 5-methylcytosine for increased triplex
CC   stability. The present sequence is used in the assay of the invention,
CC   where it can be part of the anchor DNA or reporter DNA sequence. The
CC   assay comprises adding a sample containing double-stranded DNA test
CC   sequences to an aqueous medium containing at least one complex of anchor
CC   DNA, attached to a solid support, and reporter DNA, where either a part
CC   of the anchor DNA or reporter DNA is designed to form a triple-strand
CC   structure with part of the test sequence. Triplex formation results in
CC   displacement of the reporter DNA which is detected as an indication of
CC   the presence of the DNA test sequence. The method is used to detect DNA
CC   sequences, particularly for identification of bacteria (by detecting
CC   genes for ribosomal RNA) in clinical samples, but also detection of
CC   oncogenes and Hepatitis B virus

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
XX
PS Claim 30; Page 141; 200pp; English.
XX
CC The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targetting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is a hammerhead ribozyme of the invention

PT New isolated nucleic acid encoding an isoform of human pregnancy
PT associated plasma protein E, for preventing or aborting pregnancy.
XX
PS Example 2; Page 301; 353pp; English.
XX
CC This invention describes a novel isolated nucleic acid that encodes one
CC of three new isoforms of human pregnancy associated plasma protein E,
CC hPAPP-E. The products of the invention have abortive and contraceptive
CC activity and can be used for gene therapy or in a vaccine. The nucleic
CC acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC used in pharmaceutical compositions or vaccines for preventing or
CC aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC antibodies can be used to assess the expression levels of PAPP-E isoform
CC proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC antenatally. This sequence represents an oligomer used in scanning the
CC human PAPP-E genes described in the disclosure of the invention

XX
CC   The invention describes an isolated nucleic acid encoding a G protein
CC   coupled receptor (GPCR), mutations of which cause cancer, comprising a
CC   2225 or 1921 base pair sequence, or their degenerate variants, encoding a
CC   409 residue amino acid sequence, all given in the specification, with or
CC   without conservative amino acid substitutions, or complements of the
CC   sequence of them. The encoding nucleic acid is not more than 100 kbase in
CC   length. The methods and compositions of the present invention are useful
CC   for diagnosing, investigating and/or treating disorders associated with
CC   aberrant expression or activity of GPCR-A-1, such as tumours and cancers.
CC   This sequence represents an oligonucleotide used to analyse the gene
CC   encoding human G-protein coupled receptor GPCR-A-1

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; Page 113; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

XX
CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PT   HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
XX
PS   Claim 4; Page 149; 185pp; English.
XX
CC   The invention relates to a novel short interfering RNA (siRNA) nucleic
CC   acid molecule or an enzymatic nucleic acid molecule, that modulates
CC   expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
CC   human immunodeficiency virus (HIV) or a component of HIV. The nucleic
CC   acid molecule of the invention has cytostatic, anti-HIV, and anti-
CC   rheumatic activity. The nucleic acid molecules are useful for reducing
CC   HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
CC   also useful for treating breast, ovarian, colorectal, lung, prostate,
CC   bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
CC   shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
CC   ABZ66530 - ABZ66585 represent substrate/target sequences for the human

PT   Novel short interfering RNA and enzymatic nucleic acid useful for
PT   treating cancer, modulates the expression of a nucleic acid encoding
PT   HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
XX
PS   Claim 58; Page 114; 185pp; English.
XX
CC   The invention relates to a novel short interfering RNA (siRNA) nucleic
CC   acid molecule or an enzymatic nucleic acid molecule, that modulates
CC   expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
CC   human immunodeficiency virus (HIV) or a component of HIV. The nucleic
CC   acid molecule of the invention has cytostatic, anti-HIV, and anti-
CC   rheumatic activity. The nucleic acid molecules are useful for reducing
CC   HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
CC   also useful for treating breast, ovarian, colorectal, lung, prostate,
CC   bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
CC   shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
CC   ABZ66530 - ABZ66585 represent substrate/target sequences for the human
CC   ribozymes of the invention

CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HCV
CC   DNAzyme or minus strand DNAzyme sequences disclosed in the present
CC   invention

XX
CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT Prodn. of nucleoside dimers with methylenedioxy linkage - by reacting 5'-
PT protected nucleoside 3'-methylthio:methyl ether and 3'-protected
PT nucleoside with bromine.
XX
PS Example 2; Col 27; 27pp; English.
XX
CC The invention relates to a method for linking a first nucleoside or
CC oligonucleotide to a second nucleoside or nucleotide through an OCH2O
CC linkage, starting with a 5'-protected nucleoside or nucleotide which is
CC derivatised in the 3' position with an OCH2SMe group. The method
CC comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-
CC protected nucleoside or nucleotide with bromine in the presence of 2,6-
CC diethylpyridine (DEP) and molecular sieves; and (b) treating the product
CC with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (THF). The
CC OCH2O-linked dimers can be used in the synthesis of oligonucleotide
CC analogues (containing thioformacetal linkages) e.g. useful as diagnostic
CC agents (see WO9106629)

PT Antisense inhibition of tumor necrosis factor type 1 expression for
PT diagnosis, treatment and prevention of disease, particularly tumors.
XX
PS Claim 1; Col 24; 34pp; English.
XX
CC The invention provides antisense compounds targeted to human tumour
CC necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds
CC can be used in a method of inhibiting the expression of TNFR1 human cells
CC or tissues. The antisense compounds specifically hybridize with one or
CC more nucleic acids encoding TNFR1 modulating the function of nucleic acid
CC molecules encoding TNFR1, ultimately modulating the amount of TNFR1
CC produced. The antisense compounds and method are useful as research
CC reagents and diagnostics, and in the treatment and prophylaxis of
CC infection, inflammation or tumour formation. Sequences AAZ48482-565
CC represent antisense oligos used for inhibition of the human TNFR1 mRNA

PT   Determining the concentration of a target nucleic acid, useful e.g. for
PT   detecting genetic mutations, comprises using a fluorescently labeled
PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 7; Page 24; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
CC   high (amplification of primer dimers is delayed), and the limit of
CC   quantitation is reduced. Complex probes are not needed, and amplification
CC   can be monitored in real time. The working graph for data analysis
CC   (automatically generated by a computer) has a higher correlation
CC   coefficient than conventional graphs so more accurate quantitation is
CC   possible. The current sequence represents a synthetic
CC   deoxyribooligonucleotide that was used for investigating the effects of
CC   the kind of bases in each target nucleic acid, and the kind of bases in
CC   its corresponding invention nucleic acid probe

PT Novel antisense compound targeted to nucleic acid molecule encoding tumor
PT necrosis factor receptor 1 (TNFR1), useful for treating humans having
PT disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
XX
PS Example 10; Page 44; 121pp; English.
XX
CC The invention relates to an antisense compound 8 to 30 nucleotides in
CC length targeted to nucleic acid molecule encoding tumour necrosis factor
CC receptor 1 (TNFR1), where the antisense compound inhibits expression of
CC TNFR1. The antisense compound is useful for inhibiting the expression of
CC TNFR1 in cells or tissues. The antisense compound is also useful for
CC treating an animal (preferably human) having a disease or condition
CC associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver
CC injury) or a hyperproliferative disorder such as cancer, by inhibiting
CC the expression of TNFR1. The antisense compound is useful for
CC diagnostics, therapeutics, prophylaxis and as research reagents and kits.
CC This polynucleotide sequence represents a human oligonucleotide relating
CC to the TNFR1 of the invention

PT New truncated OTK18 transcriptional repressor protein, useful for
PT treating human immunodeficiency virus infection and for identifying OTK18
PT expression in a biological sample.
XX
PS Example 2; Fig 11A; 96pp; English.
XX
CC The invention relates to methods and compositions for the treatment of
CC human immunodeficiency virus (HIV) infection. The invention also relates
CC to OTK18 transcriptional repressor protein and its corresponding nucleic
CC acid. An antibody to OTK18 is useful for identifying OTK18 expression in
CC a biological sample (e.g. polymorphonuclear blood mononucleocytes, brain
CC tissue, macrophages and CD4+ T cells). OTK18 is used for treating HIV
CC infection. It is useful for screening molecules that modulate or affect
CC its activity. Its antibody is useful for identifying multinuclear giant
CC cells in HIV encephalitic brains or immune activated mononuclear
CC phagocytes (MP) in the brains, for fluorescent activated cell sorting
CC (FACS) analysis of peripheral blood cells to evaluate the antiretroviral
CC reaction of MP and for immunoprecipitating proteins from a sample
CC containing a mixture of proteins and other biological molecules. OTK18
CC molecules are useful in the treatment and diagnosis of HIV infection, as
CC research tools to identify the control of gene expression in response to
CC HIV infection and subsequent neuronal injury. OTK18 DNA is useful in gene
CC therapy. The present sequence is HIV-1 LTR luciferase reporter gene
CC derived mutant DNA fragment used to illustrate the method of the
CC invention

PT Identifying molecules involved in lipid regulation, useful for
PT diagnosing, treating or preventing e.g., arteriosclerosis, comprises
PT identifying a molecule that binds to high bone mass gene or its
PT corresponding wild type gene.
XX
PS Disclosure; Page 41; 409pp; English.
XX
CC The invention relates to a method for identifying a molecule involved in
CC lipid regulation comprising identifying a molecule that binds to or
CC inhibits binding of a molecule to high bone mass (HBM) or its wild type
CC gene, Zmax1. Compounds identified by the method are useful for treating,
CC diagnosing, preventing or screening for normal and abnormal lipid-
CC associated conditions, including arteriosclerosis, cardiovascular
CC disease, stroke, and osteoporosis. The compounds may also be used in the
CC treatment or prevention of diabetic atherosclerosis, neurovascular
CC conditions caused by plaque build-up, poor circulation due to plaque
CC build-up and associated poor wound healing. The methods may be used in
CC gene therapy, pharmaceutical development, and diagnostic assays for bone
CC development disorders. Molecules identified by comparison of Zmax1 and
CC HBM systems can be used as surrogate markers in pharmaceutical
CC development, in diagnosis of human or animal bone disease, and in the
CC treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA
CC molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers
CC and adapters of the invention

PT   Determining methylation status of CpG dinucleotides using modified
PT   genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the
PT   characterization, grading, staging and/or diagnosis of colon cancer.
XX
PS   Claim 26; Page 159; 219pp; English.
XX
CC   The present invention describes a method for determining the methylation
CC   status of CpG dinucleotides within the genes for oestrogen receptor, p21,
CC   p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-erB2, p53
CC   and/or CEA, which comprises contacting the target nucleic acid with a
CC   reagent that distinguishes between methylated and non-methylated CpG
CC   dinucleotides, and determining from the methylation status of the CpG
CC   positions the presence of a colon cancer. A set of oligomers or peptide
CC   nucleic acid (PNA)-oligomers can be used as probes for determining the
CC   cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC   of a corresponding genomic DNA by analysis of a chemically pretreated
CC   genomic DNA. The pretreated genomic DNA is useful for the determination
CC   of the methylation status of a corresponding genomic DNA and/or detection
CC   of SNPs. The methods and pretreated genomic DNA are also useful for the
CC   characterisation, classification, diagnosis and differentiation of colon
CC   cell proliferative disorders. ACF62752 to ACF63278 represent sequences
CC   used in the exemplification of the present invention

PT Determining methylation status of CpG dinucleotides using modified
PT genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the
PT characterization, grading, staging and/or diagnosis of colon cancer.
XX
PS Claim 26; Page 158; 219pp; English.
XX
CC The present invention describes a method for determining the methylation
CC status of CpG dinucleotides within the genes for oestrogen receptor, p21,
CC p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-erB2, p53
CC and/or CEA, which comprises contacting the target nucleic acid with a
CC reagent that distinguishes between methylated and non-methylated CpG
CC dinucleotides, and determining from the methylation status of the CpG
CC positions the presence of a colon cancer. A set of oligomers or peptide
CC nucleic acid (PNA)-oligomers can be used as probes for determining the
CC cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC of a corresponding genomic DNA by analysis of a chemically pretreated
CC genomic DNA. The pretreated genomic DNA is useful for the determination
CC of the methylation status of a corresponding genomic DNA and/or detection
CC of SNPs. The methods and pretreated genomic DNA are also useful for the
CC characterisation, classification, diagnosis and differentiation of colon
CC cell proliferative disorders. ACF62752 to ACF63278 represent sequences
CC used in the exemplification of the present invention

PT Detecting and differentiating between hematopoietic cell proliferative
PT disorders, comprises contacting a target nucleic acid with a reagent that
PT distinguishes between methylated and non-methylated CpG dinucleotides.
XX
PS Claim 15; Page 50; 117pp; English.
XX
CC The present invention describes a method for detecting and
CC differentiating between haematopoietic cell proliferative disorders
CC associated with at least 1 gene and/or their regulatory regions in a
CC subject. The method comprises contacting a target nucleic acid in a
CC biological sample obtained from the subject with at least 1 reagent,
CC which distinguishes between methylated and non-methylated CpG
CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
CC represent specifically claimed nucleotide sequences from the present
CC invention. Oligonucleotides from the present invention can be used: for
CC differentiating between healthy haematopoietic cells and proliferative
CC disorder haematopoietic cells; for differentiating between acute
CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cytosine methylation state and/or single nucleotide
CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC related sequences and their complements; and as primers for the
CC amplification of haematopoietic cell proliferation disorder related DNA
CC sequences. The nucleotide sequences from the present invention can also
CC be used for detecting a predisposition to, differentiation between
CC subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC haematopoietic cell proliferative disorders. The present method enables a
CC highly specific classification of haematopoietic cell proliferative
CC disorders allowing for improved and informed treatment of patients

PT New transgenic animals (e.g. mice), useful as models for studying bone
PT density modulation, developing drugs for treating or preventing bone
PT diseases (e.g. osteoporosis), or diagnosing diseases characterized by
PT reduced bone density.
XX
PS Disclosure; Page 57; 603pp; English.
XX
CC The invention relates to novel transgenic animals expressing the high
CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene,
CC comprising an alteration of the gene encoding LRP5 or LRP6, or expressing
CC an LRP5 that is modulated by an altered gene control sequence introduced
CC by homologous or non-homologous recombination. The transgenic animals are
CC for the study of bone density modulation or bone mass modulation. The
CC invention has osteopathic and cytostatic activity. The polynucleotides of
CC the invention may have a use in gene therapy. The transgenic animals and
CC nucleic acids are for the study of bone density modulation, where the
CC bone mass is modulated relative to non-transgenic animals of the same
CC species in more than one parameter selected from bone density, bone
CC strength, trabecular number, bone size, or bone tissue connectivity. The
CC transgenic animals, nucleic acids and methods are useful for identifying
CC molecules involved in bone development, and for developing pharmaceutical
CC compositions, which may be employed for treating or preventing bone
CC diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or
CC neoplasms of the bone. The transgenic animals and nucleic acids are also
CC useful in methods for diagnosing diseases involved in bone development,
CC or characterised by reduced bone density or mass. The present sequence is
CC used in the exemplification of the invention

PS Claim 15; SEQ ID NO 577; 58pp; English.
XX
CC This invention relates to a novel method for detecting and
CC differentiating between lung cell proliferative disorders associated with
CC at least one gene and/or their regulatory regions. Specifically, it
CC refers to a method comprising contacting a target nucleic acid in a
CC biological sample with at least one reagent, wherein the reagent is able
CC to distinguish between methylated and non-methylated CpG dinucleotides
CC present in the target DNA. As such, it is possible to further
CC differentiate and diagnose medical conditions including adenocarcinoma
CC and squamous cell carcinoma, and their respective adjacent lung tissue.
CC The present invention describes cytostatic oligomers and PNA-oligomers
CC that are useful as probes for determining the cytosine methylation state
CC or single nucleotide polymorphisms (SNPs) of the target sequence. This
CC oligonucleotide sequence is a primer oligomer used for the analysis of
CC CpG positions within genomic DNA, used in an exemplification of the
CC invention.

PT   Novel analytical method designated Fine Array Transcript Mapping, useful
PT   for detecting and measuring RNA molecules transcribed from a genome,
PT   differential expression, and sequence mapping.
XX
PS   Example 1; Page 16; 53pp; English.
XX
CC   This sequence represents a forward PCR primer targeted at the ICP4 gene
CC   of herpes simplex virus type 2 (HSV-2) SB5 (ATCC VR 2546). It was used
CC   for semi-quantitative PCR analysis of SB5 cDNA. PCR using the ICP4 primer
CC   pair generated a 111 bp product, and allowed detection of 1 HSV copy from
CC   45 cycles (or 1000 copies from 35 cycles). The invention provides a novel
CC   genetic analysis method termed Fine Array Transcript Mapping (FAT
CC   Mapping) for detecting and measuring RNA molecules transcribed from a
CC   genome, differential expression, and mapping of the 5' sequence of a
CC   transcript. FAT mapping involves probing a test grid containing an array
CC   of 100s to 1000s of overlapping genomic clones or DNA fragments with
CC   probes consisting of labeled cDNAs representing the RNA transcripts from
CC   test populations. The system allows quantitative measurements of the
CC   expression of rare transcripts, and enables the analysis of 100s of genes
CC   within a genomic sequence in a single run. The method can be used to
CC   measure the differential expression of transcripts between 2 or more
CC   different viral, tissue or cell populations which share a common genomic
CC   sequence, or to determine whether a particular open reading frame is
CC   expressed under certain conditions. The FATMap technique has been applied
CC   to the HSV-2 genome

PT   Novel saccharide producing DNA which encodes a protein, useful for
PT   improving saccharide production.
XX
PS   Example 4; SEQ ID NO 11; 15pp; Japanese.
XX
CC   The present invention relates to proteins involved in saccharide
CC   production and their coding sequences (ADC65111-ADC65116) from
CC   Methylobacillus bacteria. The sequences are useful for overproducing or
CC   suppressing saccharide production. A DNA fragment of 4-8kb was obtained
CC   from the genome library of wild-strain 12S of Methylobacillus and was
CC   cloned in a plasmid pUC19. Transposon Tn5 inserted in the Ma1 strain of
CC   Methylobacillus bacteria was determined using the DNA fragment of pTMS3
CC   as probe. Colonies which hybridized to the genome library were assumed as
CC   positive clones and were named as pUMS1-X. The base sequence of the
CC   inserted DNA fragments were determined and it was found that all three
CC   open reading frames (orf) existed in the same direction and were named as
CC   orf1 (epsA; ADC65111), orf2 (epsB; ADC65113) and orf3 (epsC; ADC65115)
CC   respectively. The DNA fragment containing orf1 (epsA) was amplified by
CC   PCR using pUMS1 as template and primers ADC65120 and ADC65121. The
```

```
CC   amplified DNA fragments were introduced into two plasmid vectors namely
CC   pT7 Blue (R) vector and an extensive host- range vector pBBR122 to obtain
CC   pTepsA and PBBA. The transformed vectors were introduced into 12S strain
CC   of Methylobacillus bacteria. Bacteria were inoculated into a culture
CC   medium containing methanol as the sole source of carbon, and cultured at
CC   30 degrees C for seven days. Supernatant liquid of the culture medium was
CC   obtained and the amount of saccharide produced in the culture medium was
CC   determined by phenol sulfuric acid method. It was found that the 12S
CC   strain of Methylobacillus produced different kinds of saccharides. The
CC   yield was 1.4 times greater than the wild-strain. From this observation,
CC   it was found that orf1 epsA gene was useful in improving saccharide
CC   synthesis. The present sequence is a PCR primer, which was used in an
CC   example from the invention.

PS   Example 15; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense oligonucleotide, AS-I-618-20, is useful for inhibiting
PT   tumor cell growth.
XX
PS   Example 3; Page 32; 137pp; English.
XX
CC   The present sequence is an antisense oligonucleotide directed against the
CC   mRNA encoding the R1 component of mammalian ribonucleotide reductase.
CC   Ribonucleotide reductase catalyses the conversion of ribonucleotides to
CC   their corresponding deoxyribonucleotides and thus plays an important role
CC   in DNA synthesis and cell proliferation. Regulation of ribonucleotide
CC   reductase is altered in cultured malignant cells and increased levels of
CC   R2 protein and R2 mRNA have been found in pre-malignant and malignant
CC   tissues as compared to normal control tissue samples. The present
CC   antisense sequence is therefore useful for inhibiting tumourigenicity of
CC   neoplastic cells and inhibiting metastasis of tumour cells. It is also
CC   useful for increasing sensitivity of neoplastic cells to chemotherapeutic
CC   drugs, thus allowing chemotherapeutic treatments to be used in patients
CC   who have become resistant or less sensitive to chemotherapy. The sequence
CC   may be RNA or DNA and may comprise a modified backbone and/or nucleotide
CC   analogues

PT   Determining common functional alleles in a population - useful in the
PT   diagnosis of disease associated with allelic heterogeneity.
XX
PS   Example 1; Page 24; 78pp; English.
XX
CC   The invention relates to methods of determining a functional allele
CC   profile of a gene in a population. Functional allele profiles comprise
CC   the commonly occurring alleles in a population, and the relative
CC   frequencies at which such alleles of a given gene occur. The methods are
CC   used to identify and determine the frequency of the functional alleles of
CC   genes which display extensive allelic heterogeneity, particularly those
CC   implicated in disease or conditions, such as the BRCA1 gene associated
CC   with breast cancer, CFTR associated with cystic fibrosis, dystrophin
CC   associated with Duchenne muscular dystrophy and Becker muscular
CC   dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods can
CC   also be employed for diseases where allelic and genetic heterogeneity
CC   exist, such as breast cancer, neurofibromatosis, and hereditary non-
CC   polyposis colorectal cancer. Identification of functional alleles is
CC   necessary for identification of mutations which may be implicated in the
CC   disease. Sequences AAX32001-172 represent primers for determining the
CC   functional allele profiles of various genes. The primers are specific for
CC   genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene

PT   Determining a functional allele profile of a gene in a population by
PT   identifying the nucleotide sequence of a gene of genomic DNA from each of
PT   the individuals with a family history of functional alleles of the gene
PT   of interest.
XX
PS   Example 1; Page 9; 28pp; English.
XX
CC   The present invention relates to a method for determining a functional
CC   allele profile of a gene in a population. The method comprises
CC   identifying the nucleotide sequence of a gene of interest out of genomic
CC   DNA from each of a population of individuals identified as having a
CC   family history which indicates inheritance of functional alleles of the
CC   gene of interest, and rank ordering the frequency of occurrence of each
CC   haplotype, where the identity of the alleles containing each haplotype
CC   and the determination of their relative frequencies constitutes the
CC   functional allele profile of the gene of interest in the population. The
CC   method is useful for determining functional allele profiles which are
CC   useful in the treatment and diagnosis of diseases, for genetic and
CC   pharmacogenetic applications, and for evaluating the degree to which the
CC   gene(s) are under selective pressure. The present sequence represents a
CC   PCR primer used in the method of the invention.

PT   Recognition system, e.g. for identifying nucleic acids, comprises at
PT   least one recognition unit comprising a region with a defined structure
PT   adjacent to a region with a randomized structure.
XX
PS   Example; Fig 1; 8pp; German.
XX
CC   This invention describes a novel recognition system comprising at least 1
CC   recognition unit bound to a support, each recognition unit comprising a
CC   region A with a defined structure adjacent to a region B with a
CC   randomized structure. The recognition system is useful for screening,
CC   identifying, or characterizing at least 1 component of a sample,
CC   especially nucleic acids and/or proteins, and for screening for and/or
CC   identifying cellular or synthetic binding partners, preferably proteins,
CC   peptides, nucleic acids, chemical agents, preferably organic compounds,
CC   pharmaceuticals, plant protection agents, toxins, venoms, carcinogens,
CC   teratogens, herbicides, fungicides or pesticides

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4682; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC   The invention comprises the steps of preparing primer pairs effective to
CC   amplify a region of chromosome 22q11 shown to be unique sequences in the
CC   DiGeorge syndrome critical region; synthesizing DNA substantially
CC   complementary to a region of normal human genomic DNA or cDNA by PCR
CC   amplification using said primer pairs; and isolating a DiGeorge syndrome
CC   critical region probe from a library containing human chromosome 22 using
CC   said substantially complementary DNA. In preferred embodiments the
```

```
CC   primers are selected from the group consisting of the sequences in
CC   AAQ40161-6. (Updated on 25-MAR-2003 to correct PN field.)

PT   Human interleukin-9 variant with Met at position 117 - useful for
PT   treating atopic allergy, esp. asthma.
XX
PS   Disclosure; Page 42; 142pp; English.
XX
CC   The present sequence is a primer for the PCR amplification of exon 2 from
CC   the human interleukin 9 (hIL-9), also known as asthma associated factor
CC   1, gene. hIL-9 plays a role in atopic allergy, asthma and related
CC   disorders, e.g. bronchial hyperesponsiveness (BHR), rhinitis, urticaria,
CC   allergic inflammatory disorders of the bowel and various forms of eczema.
CC   A naturally occurring polymorphism has been identified at position 117 of
CC   hIL-9, individuals homozygous for Met at position 117 demonstrate, e.g. a
CC   lack of asthma and low serum immunoglobulin E (IgE) levels, while Thr/Thr
CC   homozygotes and Thr/Met heterozygotes are susceptible to asthma

PT   Treating inflammatory bowel diseases, e.g. Crohn's disease - and chronic
PT   non-specific ulcerative colitis by administering compounds up-regulating
PT   function of interleukin-9 or its receptor.
XX
PS   Disclosure; Page 23; 61pp; English.
XX
CC   Sequences shown in AAV41331 to AAV41340 represent exon specific primers
CC   of human interleukin (IL-9) gene. The invention provides a method for the
CC   treatment of inflammatory bowel disease (IBD) or related disorders that
CC   comprises administering a compound that up-regulates the function of IL-9
CC   or the IL-9 receptor. A method for monitoring humans undergoing IBD
CC   treatment with polypeptides with human IL-9 sequence (or fragments), by
CC   evaluating IL-9 levels in samples taken at different times, and a method
CC   for screening for cells expressing the IL-9 receptor by detecting binding
CC   of a specific ligand are also provided. Compounds up-regulating the
CC   function of IL-9 or the IL-9 receptor can be used therapeutically (in
CC   pharmaceutical compositions, optionally with acceptable carriers) to
CC   treat IBD and other related inflammatory disorders. IBDs (which include
CC   Crohn's diseases and chronic non-specific ulcerative colitis) are
CC   diseases characterised by an inappropriate inflammatory response to
CC   environmental stimuli. Immune responses to antigens are classified as Th1
CC   or Th2 responses, and evidence suggests that IBDs are dominated by a Th1
CC   mediated, antigen induced, inflammatory response. Other related Th1
CC   mediated diseases include multiple sclerosis, diabetes, arthritis, lupus
CC   and autoimmune diseases. The method is based on the observation that the
CC   Th2 response is up-regulated by IL-9

PT Novel polynucleotide of human G713 gene useful for diagnosis and
PT prophylactic treatment of brain, psychiatric disorders like schizophrenia
PT and bipolar disorders.
XX
PS Disclosure; Page 26; 271pp; English.
XX
CC The present invention describes an isolated, purified or recombinant
CC polynucleotide (PN) (I) comprising a contiguous span of 8 to 50
CC nucleotides, where the span includes a G713 or chromosome 13q31-q33
CC related biallelic marker. (I) has neuroleptic activity and can be used as
CC a G713 gene expression inhibitor. (I) can be used genotyping to estimate
CC the frequency of an allele of a G713 or chromosome 13q31-q33 related
CC biallelic marker in a population, and of a haplotype for a set of
CC biallelic markers in a population. (I) is also useful in detecting an
CC association between a haplotype and a trait. The frequency is used for
CC detecting an association between a genotype and a trait being
CC schizophrenia. The genotype is used to determine whether an individual is
CC at risk of developing schizophrenia. (I) can also be used as a medicament
CC against several disorders preferably brain, psychiatric disorders such as
CC schizophrenia and bipolar disorder. Early identification of risk of
CC developing schizophrenia is possible, which would enable early and/or
CC prophylactic treatment. AAA55964 to AAA55966 represent human G713 genomic
CC DNA sequences; AAA55967 encodes the human G713 protein AAY90962; AAA55968
CC encodes the murine G713 protein AAY90963; AAA55992 to AAA56030 represent
CC human chromosome 13q31-q33 locus biallelic markers A12 to A49; AAA55969
CC to AAA55991, and AAA56031 and AAA56032 represent PCR primers used in the
CC exemplification of the present invention

CC AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC invention, which contain a polymorphic base at position 24 of their
CC nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC primers for the biallelic markers. The biallelic markers of the invention
CC have a variety of uses: they can be used for high density mapping of the
CC human genome, and in complex association studies and haplotyping studies
CC which are useful in determining the genetic basis for disease states.
CC Compositions and methods of the invention can also be useful for the
CC identification of the targets for the development of pharmaceutical
CC agents and diagnostic methods, as well as the characterisation of the
CC differential efficacious responses to and side effects from
CC pharmaceutical agents acting on a disease as well as other treatment.
CC N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and
CC 3367, are not actually given a sequence in the Sequence Listing from the
CC present invention

PT   New antisense oligonucleotides for modulating cot oncogene expression,
PT   particularly useful for diagnosing or treating diseases associated with
PT   expression of cot oncogene, such as inflammation, cancer or immune system
PT   disorders.
XX
PS   Claim 3; Col 41; 39pp; English.
XX
CC   The invention relates to antisense oligonucleotides, compositions and
CC   methods for modulating cot oncogene expression. The cot oncogene is also
CC   known as Tpl-2 and est. The compositions comprise antisense compounds,
CC   particularly antisense oligonucleotides, targetted to nucleic acids
CC   encoding cot oncogene. The antisense oligonucleotides are useful for
CC   modulating the expression of cot oncogene and for treating diseases
CC   associated with expression of cot oncogene, e.g. inflammation, cancer or
CC   disorders of the immune system. The antisense oligonucleotides are also
CC   useful for diagnosis or prophylaxis or as research reagents and kits. The
CC   present sequence is human cot oncogene antisense oligonucleotide, ISIS
CC   116372. This sequence was targetted towards the coding region of human
CC   cot oncogene

PT   Novel oligonucleotide sequences of internal transcribing spacer region of
PT   non-tuberculosis mycobacteria (NTM) used as probes or primers for
PT   detecting and identifying mycobacteria and distinguish TB complex from
PT   NTM.
XX
PS   Claim 32; Page 75; 89pp; English.
XX
CC   The present sequence is an oligonucleotide developed using a
CC   Mycobacterium ITS (internal transcribed spacer region) nucleotide
CC   sequence. ITS DNA sequences from M. fortuitum, M. chelonae, M. abscessus,
CC   M. vaccae, M. flavescens, M. asiaticum, M. porcinum, M. acapulcensis, M.
CC   diernhoferi genes were identified. The oligonucleotides derived from
CC   these sequences were used to develop PCR primers and hybridisation probes
CC   for detection and identification of Mycobacterium. ITS has a more
CC   polymorphic region than 16S rRNA and also has a conserved region. It is
CC   therefore highly effective as a target DNA for distinction of genotype.
CC   The oligonucleotide probes, attached to solid substrate, hybridise only
CC   with nucleotide sequences in ITS of specific mycobacteria, and thus they
CC   can detect and identify the specific mycobacteria sensitively. The
CC   oligonucleotides can also detect and identify the specific mycobacteria
CC   by PCR amplification. Using the oligonucleotide primers or probes made
CC   from ITS of mycobacteria, it is possible to detect mycobacteria,
CC   distinguish tuberculosis (TB) complex from non-tuberculosis mycobacteria
CC   (NTM), and to identify mycobacteria species accurately and effectively.
CC   (Updated on 06-AUG-2003 to correct OS field.)

PT   Hybrid oligomer comprises a cyclic AMP response element sequence and a
PT   sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for
PT   preventing or treating cell-proliferative disorders e.g., cancer.
XX
PS   Disclosure; Page 13; 78pp; English.
XX
CC   The invention relates to a hybrid oligomer comprising a cyclic AMP
CC   response element (CRE) sequence and a sequence that hybridises to the bcl
CC   -2 pre-mRNA or mRNA. Also included are: (1) inhibiting the growth of
CC   cancer cells in vitro, which comprises contacting the cancer cells with a
CC   hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer;
CC   (2) treating or preventing cancer in a human, which comprises
CC   administering a hybrid oligomer or a bcl-2 antisense oligomer and a CRE
CC   decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid
CC   oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and a
CC   carrier. The pharmaceutical composition of the invention is useful for
CC   preventing or treating cell-proliferative disorders e.g., cancer,
CC   hyperplasia or tumourigenesis and also bacterial infection, viral
CC   infection, inflammation, anaphylaxis, allergy, arthritis, asthma,
CC   autoimmune disorders and parasitic infection. The CRE decoy oligomer and
CC   bcl-2 antisense oligomer are also useful for preventing or treating
CC   hepatitis B virus infection. The hybrid oligomers can also be used for
CC   screening candidate transcription factors or other molecules e.g., gene
CC   regulatory proteins or for diagnostic assays. The present sequence is a
CC   Bcl-2 antisense oligonucleotide

PT   Novel polypeptide regulated by nitric oxide useful for inducing acute
PT   myeloid leukemia cell differentiation and apoptosis.
XX
PS   Example 6; Page 8; 23pp; English.
XX
CC   The present invention relates to novel genes which are upregulated by
CC   nitric oxide (NO), designated as rno and their corresponding proteins.
CC   The invention also relates to the isolation and characterisation of three
CC   isoforms of rno gene, rno-1, rno-2, rno-3. rno proteins of the invention
CC   are useful for inducing differentiation and death in a cancer cell.
CC   Diagnosing acute myeloid leukaemia (AML) comprises detecting the
CC   expression of a rho gene comprising the nucleotides coding for rno
CC   protein. The present DNA sequence is actin specific reverse transcription
CC   (RT)-PCR primer. This primer is used in the exemplification of the
CC   invention

PT   Novel antisense oligonucleotide that specifically hybridizes with and
PT   inhibits nucleic acid encoding epidermal growth factor receptor, useful
PT   for treating hyperproliferative disease such as cancer or psoriasis.
XX
PS   Claim 1; Page 45; 169pp; English.
XX
CC   The invention relates to an antisense oligonucleotide targetted to a
CC   nucleic acid molecule encoding human epidermal growth factor receptor
CC   (Her1) to inhibit its expression. The antisense compounds are useful for
CC   treating diseases or conditions associated with Her-1 such as
CC   hyperproliferative diseases especially cancer (lung, ovarian, colon or
CC   prostrate cancer) and psoriasis. They are also useful as research
CC   reagents, diagnostics, therapeutics, kits and prophylactically e.g. to
CC   prevent or delay tumour formation. The present sequence is an antisense
CC   oligonucleotide targetted to human Her-1

PT Novel chemically modified genomic DNA sequences, useful in the
PT characterization, classification, differentiation, grading, staging,
PT treatment and/or diagnosis of astrocytomas or predisposition to
PT astrocytomas.
XX
PS Example; Page 25; 37pp; English.
XX
CC The invention relates to a nucleic acid comprising a sequence (I) of at
CC least 18 bases in length of a segment of chemically pre-treated genomic
CC DNA which has any one of the sequences of (ABK33919-ABK34032) or its
CC complement. Also included are an oligonucleotide or peptide nucleic acid
CC (or set thereof) of at least 9 nucleotides which hybridises to (I),
CC primers for (I), probes for detecting cytosine methylation or single-
CC nucleotide polymorphisms (SNP) in (I), an array of oligomers or peptide
CC nucleic acids for analysing diseases associated with the methylation
CC states of the CpG dinucleotides of (I). The array is useful for
CC determining genetic and/or epigenetic parameters, classification,
CC differentiation, grading, staging, treatment and/or diagnosis of
CC astrocytomas, or the predisposition to astrocytomas by analysing cytosine
CC methylations, involves obtaining a biological sample containing genomic
CC DNA, extracting the genomic DNA, converting cytosine bases which are
CC unmethylated at the 5-position, in the genomic DNA sample, to uracil or
CC another base which is dissimilar to cytosine in terms of hybridisation
CC behaviour, by chemical treatment and amplifying chemically pre-treated
CC genomic DNA fragments using the array and a polymerase, where the
CC amplificates carry a detectable label. The method further involves
CC identifying methylation status of one or more cytosine positions, and
CC analysing methylation status of the cytosine positions by reference to
CC one or more data sets. The genomic DNA is chemically treated by using a
CC bisulphite, hydrogen sulphite or disulphite. The amplification step
CC amplifies DNA which is of particular interest in astrocytoma or brain
CC tissue, based on the specific genomic methylation status of brain
CC tissues, as opposed to background DNA. The amplificates carry a
CC fluorescent label or radionuclide. Optionally, the labels of the
CC amplificates are detachable molecule fragments having a typical mass
CC which are detected in a mass spectrometer. The fragments of chemically
CC pre-treated genomic DNA to be amplified, have a single positive or
CC negative charge for a better detectability in the mass spectrometer.
CC Preferably, the amplificates or fragments of the amplificates are
CC detected by matrix assisted laser desorption/ionization mass spectrometry
CC (MALDI) or using electron spray mass spectrometry (ESI). The present
CC sequence is a PCR primer used to amplify a region containing a methylated
CC cytosine from one of the chemically pre-treated reference DNA samples of
CC the invention. Note: The sequence data for this patent did not form part
CC of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT Species-specific detection of animal DNA, useful for analyzing foods and
PT feeds, by amplifying gene common to all animals, then testing amplicon
PT with specific probes.
XX
PS Claim 13; Page 15; 24pp; German.
XX
CC The invention relates to a method for determining the absence or presence
CC of DNA of a particular animal species in a sample by polymerase chain
CC reaction (PCR) amplification using a primer mixture (ABZ26083-ABZ26085)
CC that includes a labeled primer that hybridises to conserved regions of a
CC gene present in all species being tested for. The amplicon is then tested
CC for hybridisation with species-specific probes (ABZ26086-ABZ26095). The
CC method is especially used to determine the origin of foods and animal
CC fodder. The method requires neither restriction enzymes nor gel
CC electrophoresis, provides high sample throughput (including analysis in
CC parallel) and produces few incorrect results and can be applied to
CC practically all foods

PT Novel methods to detect genetic changes associated with DiGeorge
PT syndrome, Velocardiofacial syndrome, CHARGE association, conotruncal
PT defect and/or cleft palate are useful for prenatal screening for the
PT diseases.
XX
PS Claim 8; Col 40; 56pp; English.
XX
CC The invention relates to methods of detecting genetic deletions,
CC translocations and mutations associated with at least one condition
CC selected from the group consisting of DiGeorge syndrome (DGS), CHARGE
CC association, Velocardiofacial (Shprintzen) syndrome (VCF), conotruncal
CC defect and/or cleft palate in a human patient. DGS is linked to
CC chromosomal deletion of chromosome 22. The method involves identifying in
CC a sample DNA if there are less than 2 functional copies of chromosome
CC 22q11 and including locus D22S36 to locus BCRL2, indicating a genetic
CC deletion or mutation associated with the conditions. The method is useful
CC for diagnosing DGS, VCF, CHARGE association, conotruncal defect and/or
CC cleft palate, particularly in prenatal monitoring. The present sequence
CC is a PCR primer used to amplify a region of human chromosome 22q11

PT Novel antisense oligonucleotide complementary to B cell lymphoma/leukemia
PT -2 mRNA, useful for inhibiting cancer cell growth, for treating
PT autoimmune disorders, and for ex vivo bone marrow purging.
XX
PS Disclosure; Fig 13C; 41pp; English.
XX
CC The present sequence represents an antisense oligonucleotide
CC complementary to B cell lymphoma/leukemia-2 (bcl-2) mRNA. The antisense
CC oligonucleotide is useful for inhibiting cancer cell (lymphoma or
CC leukemia cells) growth, for increasing the sensitivity of cancer cells to
CC cancer chemotherapeutic agents, or for inducing cancer cell death alone
CC or in combination with any one or more cancer chemotherapeutic agents. It
CC is also useful for reducing the bcl-2 gene expression or impairing bcl-2
CC protein function, for ex vivo bone marrow purging, for removing residual
CC malignant cells from the bone marrow, for inhibiting cancer of neoplastic
CC cell growth, and for treating autoimmune disease

PT   Oligonucleotide for diagnosing and treating tumors and cancer especially
PT   gliomas, astrocytomas and oligodendromas, comprises chemically modified
PT   genomic sequences of genes associated with tumors and cancers.
XX
PS   Example 4; Page 22; 31pp; English.
XX
CC   The invention relates to a nucleic acid (I) comprising a sequence of at
CC   least 18 bases of a segment of chemically pretreated genomic DNA (II)
CC   according to one of the sequences (S1) selected from 120 sequences, and
CC   its complementary sequences. Also included are an oligomer (III),
CC   especially an oligonucleotide or peptide nucleic acid (PNA)-oligomer,
CC   comprising a sequence of at least 9 nucleotides which hybridises to or is
CC   identical to (II), and complementary sequences, a set of oligomers (IV)
CC   comprising at least two (III) and their use for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms (SNPs) in (II),
CC   and manufacturing (M1) an arrangement of different oligomers (array)
CC   fixed to a carrier material for analysing diseases associated with the
CC   methylation state of the CpG dinucleotide of (S1), where at least one
CC   oligomer is coupled to solid phase. The set of oligomers (IV) are useful
CC   as primer oligonucleotides for the amplification of (II) especially for
CC   characterising classifying and differentiating oligodendroglioma,
CC   astrocytoma and oligoastrocytoma tumours (by ascertaining genetic and/or
CC   epigenetic parameters of genomic DNA by analysing cytosine methylation
CC   and single nucleotide polymorphisms). The present sequence is a PCR
CC   primer used to amplify the modified genomic sequence from a gene
CC   associated with brain tumours

PT   New antisense compound which is targeted to nucleic acid encoding
PT   phosphorylase kinase alpha 1 and inhibits expression of kinase protein,
PT   useful for treating a condition associated with kinase, e.g. diabetes.
XX
PS   Claim 3; Page 91; 140pp; English.
XX
CC   This invention relates to a novel antisense nucleic acid compound
CC   targeted to a nucleic acid molecule encoding phosphorylase kinase alpha-1
CC   which specifically hybridises with and inhibits expression of
CC   phosphorylase kinase alpha-1. The compound of the invention is useful for
CC   inhibiting the expression of phosphorylase kinase alpha-1 in cells or
CC   tissues, and for treating an animal having a disease condition associated
CC   with phosphorylase kinase alpha-1, e.g. a metabolic disorder such as
CC   diabetes. The compounds are also useful prophylactically, e.g. to prevent
CC   or delay infection, inflammation or tumour formation. The antisense
CC   compounds are also useful as therapeutic, diagnostic and research
CC   reagent, for distinguishing functions of various members of a biological
CC   pathway, and in antisense gene therapy. The present sequence represents
CC   an antisense oligonucleotide probe used to create the phosphorylase
CC   kinase alpha-1 inhibiting compound of the invention

PT Treating or preventing cancer, tumors and carcinomas, comprises
PT administering B cell lymphoma/leukemia-2 antisense oligonucleotide at
PT high doses for short period for time with one or more cancer
PT therapeutics.
XX
PS Disclosure; Page 64; 64pp; English.
XX
CC The present invention is related to the use of a B cell
CC lymphoma/leukaemia-2 (bcl-2) antisense oligonucleotide, particularly
CC G3139 (see ABL54148), to treat and prevent bcl-2 related disorders.
CC Administration at high doses results in significant therapeutic
CC responses, including low toxicity, high tolerance and prolonged survival.
CC Administration at high doses for short periods of time (less than 14
CC days) also provides significant therapeutic responses in the treatment of
CC cancer. The bcl-2 antisense oligomer may also be used to increase the
CC sensitivity of a subject to cancer therapeutics, and in combination with
CC hormone treatment or gene therapy. Conditions that may be treated or
CC prevented include cancer of the haematopoietic system, skin, bone and
CC soft tissue, reproductive system, genitourinary system, breast, endocrine
CC system, brain, central nervous system, peripheral nervous system, kidney,
CC lung, respiratory system, thorax, gastrointestinal and alimentary canal,
CC lymph nodes, pancreas, hepatobiliary system, or cancer of unknown primary
CC site, non-Hodgkin's lymphoma, Hodgkin's lymphoma, leukaemia, colon
CC carcinoma, rectal carcinoma, pancreatic, breast, ovarian, prostate,
CC cervical, testicular, head and neck or brain cancer, renal cell
CC carcinoma, hepatoma, bile duct carcinoma, choriocarcinoma, lung
CC carcinoma, bladder carcinoma and melanoma (all claimed). Note: The
CC present sequence is given in the Sequence Listing from the present
CC invention but the Seq ID No. is not referred to within the specification

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Claim 15; SEQ ID NO 935; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX
CC This invention describes a novel human ABCC12 (adenosine triphosphate
CC (ATP)-binding cassette transporter gene subfamily C12, i.e. cystic
CC fibrosis transmembrane conductance regulator/multidrug resistance-like
CC subgroup (CFTR/MRP) family) polypeptide and its encoding polynucleotides
CC The polypeptide is useful for screening agonists and antagonist of the
CC ABCC12 polypeptide. The products of the invention are useful for
CC screening an active ingredient for preventing and treating paroxysmal
CC kinesigenic choreoathetosis or pathologies linked to dysfunction of
CC transport of organic anion transporters such as cysteinyl leukotriene,
CC anionic drugs, such as methotrexate, neutral drugs conjugated to acidic
CC ligands, such as glutathione, glucuronate or sulphate conjugated drugs
CC and can be used for somatic gene therapy. This sequence represents a
CC region corresponding to an exon/intron boundary from the gene encoding a
CC human ABCC12 isoform described in the disclosure of the invention

PT methylation.
XX
PS Example 2; Page 17; 376pp; English.
XX
CC The invention relates to a method of determining genetic and/or
CC epigenetic parameters for the classification, differentiation and/or
CC diagnosis of prostate tumours or the predisposition to prostate cancer,
CC by analysing cytosine methylation in a sample of genomic DNA. The method
CC comprises chemically treating unmethylated cytosine bases at the 5-
CC position to uracil or another base, which is dissimilar to cytosine in
CC terms of hybridization behaviour; followed by amplifying at least one
CC fragment of the chemically pre-treated genomic DNA using sets of primer
CC oligonucleotides and a polymerase. The oligomers or probes derived from
CC them are useful for detecting the methylation state of all CpG
CC dinucleotides and/or single nucleotide polymorphisms (SNPs) in a
CC chemically pre-treated genomic DNA. They are all useful for treating
CC prostate carcinoma. This sequence represents an oligonucleotide used to
CC amplify a gene possibly involved in predisposition to prostate cancer
CC which may contain methylated or unmethylated CpG dinucleotides.

PS Example 2; Page 17; 211pp; English.

```
XX
CC   The invention relates to a novel method for characterising, classifying
CC   and/or differentiating renal and prostate cancer. The method comprises
CC   extracting genomic DNA from a biological sample, converting cytosine
CC   bases (by chemical treatment) that are unmethylated at the 5-position to
CC   uracil or another base, and amplifying at least one fragment of the
CC   chemically pretreated genomic DNA using sets of primer oligonucleotides
CC   and a polymerase. The method is useful for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms in genomic DNA,
CC   particularly for characterising, classifying and/or differentiating renal
CC   and prostate cancers. The oligomers are useful as primer oligonucleotides
CC   for the amplification of any of the 112 DNA sequences of the invention.
CC   The set of oligomer probes is useful for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms in any of the
CC   112 chemically pretreated genomic DNA sequences. The method is also
CC   useful for identifying the tissue of origin of cancer cells. The method
CC   allows the classification, differentiation and/or diagnosis of cancer
CC   tissues using minute samples which would be inadequate for histological
CC   or cytological analysis. The present sequence is used in the
CC   exemplification of the invention.

PT   Detecting point mutation in DNA strand, by hybridizing target DNA strand
PT   having mutation with test DNA strand to form duplex, contacting the
PT   duplex with RNase H and determining the cleavage of test strand by RNase
PT   H.
XX
PS   Example 5; Fig 4; 26pp; English.
XX
CC   The invention relates to a novel method for detecting a point mutation in
CC   a DNA strand. The novel method comprises hybridising a target DNA strand
CC   containing or suspected of containing a point mutation with a test
CC   nucleic acid strand complementary to the DNA strand to form a target DNA
CC   strand/test nucleic acid strand duplex, contacting the duplex with an
CC   RNase H, and determining whether the ribonucleotide residues within the
CC   nucleotide sequence are cleaved by RNase H. The method is useful for
CC   detecting a point mutation in a DNA strand, where the point mutation to
CC   be detected is a single nucleotide polymorphism, preferably a
CC   polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian
CC   or human genome. The method is useful to detect any nucleic acids from
CC   any species of organisms such as Acintobacter, Bacillus, Candida,
CC   Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
CC   This polynucleotide sequence represents an oligo relating to the mutation
CC   detecting method of the invention

```

```
XX
PS   Claim 3; Page 26; 72pp; English.
XX
CC   The invention relates to a compound 8-50 nucleobases in length targeted
CC   to a nucleic acid molecule encoding complement component C3. The compound
CC   specifically hybridises with the nucleic acid molecule encoding
CC   complement component C3 and inhibits the expression of complement
CC   component C3, or specifically hybridises with at least an 8-nucleobase
CC   portion of an active site on a nucleic acid molecule encoding complement
CC   component C3. Also included are a composition comprising the compound and
CC   a pharmaceutical carrier or diluent, inhibiting the expression of
CC   complement component C3 in cells or tissues (comprising contacting the
CC   cells or tissues with the compound cited above) and treating an animal
CC   having a disease or condition associated with complement component C3
CC   comprising administering to the animal the compound cited above so that
CC   expression of complement component C3 is inhibited. The antisense
CC   compounds are useful for inhibiting the expression of complement
CC   component C3 in cells or tissues, or for treating an animal having a
CC   disease or condition associated with complement component C3 such as an
CC   autoimmune disorder (e.g. multiple sclerosis), an infection, or
CC   atherosclerosis, inflammation, septic shock, multiple organ failure,
CC   hyperacute organ failure and CNS inflammation. The compounds are also
CC   useful as research reagents and diagnostics, in distinguishing functions
CC   of various members of a biological pathway, or for preventing or delaying
CC   infection, inflammation or tumour formation. The present sequence is an
CC   antisense oligonucleotide targeting human C3.

XX
CC   The present invention describes a method for typing at least two variable
CC   sites of at least one nucleic acid molecule related to cystic fibrosis.
CC   The method comprises: (a) providing at least one nucleic acid molecule of
CC   a gene related to cystic fibrosis; (b) providing at least one extension
CC   primer, which binds to different predetermined sites in the nucleic acid
CC   molecules, where at least one extension primer is designed to extend over
CC   at least two potential variable sites in the nucleic acid molecule, and
CC   nucleotide; (c) simultaneously or sequentially performing primer
CC   extension reactions; and (d) determining the pattern of nucleotide
CC   incorporation to obtain a test pattern; optionally (e) comparing the test
CC   pattern of step (c) with one or more reference patterns, in order to type
CC   the variable sites of the nucleic acid molecules. Also described: (1)
CC   diagnosing the genetic predisposition of states, diseases and drug
CC   response related to the human cystic fibrosis transmembrane conductance
CC   regulator (CFTR) gene; and (2) a kit for use in the method for typing
CC   comprising at least one extension primer. The method is useful for typing
CC   at least two variable sites of at least one nucleic acid molecule related
CC   to cystic fibrosis. The present sequence represents a human CFTR
CC   sequencing primer, which is used in the exemplification of the present
CC   invention.

PT   Novel isolated nucleic acid molecule comprising single nucleotide
PT   polymorphism associated with fish, useful for forming PCR primers which
PT   are used for detecting single nucleotide polymorphisms in fish nucleic
PT   acids.
XX
PS   Claim 18; SEQ ID NO 1049; 233pp; English.
XX
CC   The present invention describes an isolated nucleic acid (I) comprising a
CC   single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC   Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC   and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC   (i), or its complement under highly stringent hybridisation conditions.
CC   Also described: (1) an isolated oligonucleotide (II) comprising at least
CC   17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC   a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC   of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC   origin of fish sample comprising providing a parentage genotype database
CC   comprising a collection of candidate parent genotypes, where each of the
CC   candidate parent genotype represents a distinct origin, and comparing a
CC   sample genotype to the parentage genotype database, where a match between
CC   the sample genotype and one of the candidate parent genotype identifies
CC   to the origin of the sample. (M1) is useful for determining the origin of
CC   a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC   rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC   detecting nucleic acid molecule comprising SNP in a sample, which
CC   involves contacting the sample containing nucleic acids with one or more
CC   (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC   SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC   useful for detecting nucleic acid molecule comprising a polymorphic
CC   sequence in a sample, comprising contacting the sample containing nucleic
CC   acids with one or more (II) which is derived from O. niloticus
CC   microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC   sites or seabass polymorphic sites, and identifying a nucleic acid that
CC   hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC   comprising a microsatellite sequence in sample. The present sequence is
CC   used in the exemplification of the present invention.

XX
CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

XX
CC   The present sequence represents a sequence tagged site (STS) primer used
CC   in the isolation of cosmids from the DPC4 (deleted in pancreatic cancer,
CC   locus 4) region, and gene identification. DPC4 is a tumour suppressor
CC   gene. Detection of truncated DPC4 protein, or of homozygous deletions or
CC   intragenic mutations in the nucleic acid encoding it, is used to diagnose
CC   (in vivo or in vitro) proliferative diseases, especially pancreatic
CC   carcinoma, bile duct, bladder or colorectal cancer, Crohn's disease,
CC   colitis-associated neoplasia or chronic ulcerative colitis. These
CC   conditions, where associated with a homozygous deletion, can be treated
CC   by administering an agent that: (a) modulates DPC4 expression,
CC   specifically a sense DPC4 sequence (particularly in the form of a vector,
CC   i.e. by gene therapy), but also an antisense sequence where DPC4 protein
CC   is over expressed or (b) mimics the activity of DPC4. DPC4 nucleic acid
CC   is also used as hybridisation probes for detecting presence/absence of
CC   human chromosome 18q21.1 fragments. When a homozygous deletion is
CC   detected in this region, an agent can be administered that accumulates
CC   within, or kills, only cells which contain such a deletion. This agent
CC   exploits the absence of an enzyme (or other protein) encoded by a
CC   neighbouring gene and lost by the deletion, i.e. it has a highly
CC   selective action

XX
CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT Novel dysferlin genes and related proteins useful for diagnosis, risk
PT identification and treatment of hereditary muscular dystrophies and other
PT dysferlin related disorders.
XX
PS Claim 8; Page 130; 146pp; English.
XX
CC This invention describes a novel human dysferlin nucleic acid (I) and its
CC encoding protein (II), which has anti-dystrophic activity and can be used
CC for gene therapy. Introduction of (I), a vector comprising (I) or
CC dysferlin into a cell of a mammal can be used to decrease the symptoms of
CC muscular dystrophy. The dysferlin gene is normally expressed in skeletal
CC muscle cells and is selectively mutated in several families with the
CC hereditary muscular dystrophies, e.g. Miyoshi myopathy and limb girdle
CC muscular dystrophy-2B. The primers and oligonucleotides derived from (I)
CC can be used in diagnosis of or risk identification for dysferlin-related
CC disorders in patients, fetus, or pre-embryos. Expression of brain-
CC specific dysferlin may be important as a marker for normal neural
CC development. Dysferlin DNA or subgenomic coding sequences can be used for
CC therapy of the hereditary muscular dystrophies. AAX82919-X82945 represent
CC PCR primers used in the method of the invention

XX
CC The present invention describes an isolated dysferlin DNA of 20-25
CC nucleotides in length, comprising a nucleotide sequence specifically
CC selected from nucleotides 911-913, 929-948, 1019-1038, 1392-1411, 1424-
CC 1443, 1484-1503, 1499-1518, 1543-1565, 1715-1734, 1714-1759, 2241-2260,
CC 2864-2883, 2978-2997, 3057-3076, 3198-3217, 3252-3271, 4356-4375, 4665-
CC 4684, 5015-5034, 5610-5629, 5726-5735, 6035-6054, 6179-6198, 6243-6263
CC and 6529-6548 of the human dysferlin nucleotide sequence given in
CC AAA36744. Dysferlin nucleotide sequences containing specific mutations
CC can be used for diagnosing a patient, a foetus or a pre-embryo at risk of
CC developing a dysferlin associated disorder by detecting mutations in the
CC dysferlin gene in biological samples from patients. Alternatively, the
CC biological sample containing genomic DNA can be incubated with a
CC restriction enzyme, preferably BanII, Bsp1286I, RsaI, HhaI, HaeIII,
CC Bsp1286, NlaIV, NlaIII, BcgI, AvaII, BstEII, PleI, HaeI, AluI, ApoI,
CC Tsp509I, SalI, HincII, TaqI, HinfI, TfiI, SfaNI or FokI and the presence
CC or absence of a restriction enzyme site in the sample is detected as an
CC indication of the presence or absence of a particular mutation in the
CC sample. Dysferlin polynucleotides are useful for treating hereditary
CC muscular dystrophies such as miyoshi myopathy (MM) and limb girdle
CC muscular dystrophy-2B (LGMB-2B). MM and LGMB-2B map to the human
CC chromosome 2p12-14 region between the genetic markers D2S292 and D2S286.
CC The present sequence represents a primer for human dysferlin

XX
CC   The present sequence is a PCR primer for the gene for human rack1, which
CC   was used as a control when the expression of H174 and Mig in brain tissue
CC   were being measured. H174 is a member of the non-ELR group of the CXC-
CC   chemokine family, as are Mig and IP10. Two clones of the H174 gene were
CC   isolated by screening a peripheral blood mononuclear cell cDNA library
CC   for cDNAs encoding secreted proteins. IP10 was used in a sequence
CC   alignment with H174, along with Mig. The H174 gene, protein, its
CC   antibodies, agonists and antagonists are useful in diagnosing and
CC   treating the following diseases: AIDS-related dementia, multiple
CC   sclerosis, Miller Fisher syndrome, spongiform encephalopathy, viral
CC   encephalomyelitis, post-rabies-vaccine encaphalomyelitis, postinfectious
CC   encephalomyelitis, paraneoplastic neuronopathy, paraneoplastic cerebellar
CC   degeneration, acute inflammatory demyelinating polyradiculoneuropathy,
CC   Guillain-Barre syndrome, experimental auto-immune neuritis, acute
CC   inflammatory polyneuropathy, chronic inflammatory polyneuropathy, chronic
CC   inflammatory demyelinating polyneuropathy, chronic relapsing inflammatory
CC   polyneuropathy, the polyneuropathy associated with monoclonal gammopathy,
CC   IgM monoclonal anti-myelin-associated glycoprotein-associated
CC   demyelinating polyneuropathy, Lambert-Eaton myasthenic syndrome,
CC   myasthenia grave, multifocal motor neuropathy with or without GM1
CC   antibodies, inflammatory myopathy, stiff-man syndrome and autoimmune
CC   neuromyotonia. Suggested activities include nutritional activities,
CC   cytokine and cell proliferation/differentiation activity, immune
CC   stimulating or suppressing activity, haematopoiesis regulating activity,
CC   tissue growth activity, activin/inhibin activity, haemostatic and
CC   thrombolytic activity, receptor/ligand activity, anti-inflammatory
CC   activity, cadherin/tumour invasion suppression activity, tumour
CC   inhibition activity and chemotactic/chemokinetic activity

XX
PS   Example; Page 37; 116pp; English.
XX
CC   This sequence represents a sequencing primer used within the scope of the
CC   invention. The invention relates to a method for preparing definitive
CC   ectoderm equivalent (DEE) cells in vitro comprising providing: (a) early
CC   primitive ectoderm-like (EPL) cells; and (b) a conditioned medium or
CC   extract exhibiting neural inducing properties and culturing the EPL cells
CC   for a time to permit controlled differentiation to DEE cells. The DEE
CC   cells, or their differentiated or partially differentiated progeny are
CC   useful in human cell therapy or transgenic animal production and for use
CC   in human or animal gene therapy. The method is useful for preparing DEE
CC   cells in vitro. It can also be used for selectively producing
CC   neuroectoderm cells or surface ectoderm cells from DEE cells. The method
CC   can also be used to produce genetically modified DEE cells. It is also
CC   useful for preparing tissues or organ for transplant. The cells are
CC   useful for treating and curing neurodegenerative diseases such as
CC   Parkinson's disease and Alzheimer's disease and pathological conditions
CC   such as stroke and spinal cord injury by replacing or assisting the
CC   function of normal disease tissues. They are also useful for the
CC   treatment of corneal disorders. The methods are useful for producing
CC   cells as a source for reprogramming and for use in pharmaceutical or
CC   toxicological screening

PT   Identifying inhibitor active on conditionally essential gene (EG) subject
PT   to loss of heterozygosity in cancer, useful in cancer treatment, involves
PT   determining two alleles of EG and testing potential allele specific
PT   inhibitor.
XX
PS   Disclosure; Fig 2; 43pp; English.
XX
CC   The specification describes a method for identifying inhibitors active on
CC   conditionally essential genes subject to loss of heterozygosity in
CC   cancer. The method involves determining two alleles of the essential
CC   gene, testing potential allele specific inhibitors to determine whether
CC   the inhibitor is active on at least one but less than all of alleles. The
CC   inhibitors suppress either the synthesis or the biological activity of
CC   the target allelic gene product. The inhibitors are useful for treating
CC   or preventing cancer or other proliferative disorders in a patient. They
CC   are also useful for inhibiting growth of a cell by subjecting the cell to
CC   conditions such that the gene is essential and administering an inhibitor
CC   active on an allele of the conditionally essential gene. Use of allele
CC   specific inhibitors allows specific killing or reduction of growth of
CC   cancer cells. AAF80072-AAF80115 represent the sequences around
CC   polymorphism sites of various target genes

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 62; 62pp; English.
XX
CC   The present sequence is that of a single mismatch target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Experiments with the present
CC   sequence and a perfectly-matched target (see ABL57071) showed that
CC   hybridisation was very specific to the matched target. The invention
CC   relates generally to the use of metal surface quenchers such as particles
CC   or films for high sensitivity applications in, for example, detection and
CC   diagnostic systems

PT   Regenerating nervous tissue, involves contacting the tissue with Schwann
PT   cells expressing DeltaSCIP to regenerate the nervous tissue.
XX
PS   Disclosure; Page 5; 21pp; English.
XX
CC   The invention relates to regenerating nervous tissue, involves contacting
CC   the tissue with Schwann cells expressing DeltaSCIP (a mutant form of the
CC   SCIP (not defined) gene under control of the P0 promoter (a myelin
CC   structural protein). SCIP is a transcription factor also known as Oct-6
CC   and Tst-1) to regenerate the nervous tissue. Also included are treating a
CC   subject in need of nervous tissue regeneration, by introducing Schwann
CC   cells expressing DeltaSCIP and inducing nervous tissue regeneration in a
CC   subject in need of such treatment, by administering to the subject,
CC   DeltaSCIP to induce nervous tissue regeneration in the subject. The
CC   methods are useful for useful for regenerating nervous tissue and for
CC   treating a subject in need of nervous tissue regeneration, where the
CC   subject in need of nervous tissue regeneration has a neurodegenerative
CC   disease. The neurodegenerative disease is Alzheimer's disease, Pick's
CC   disease, Huntington's disease, Parkinson's disease, cerebral palsy,
CC   amyotrophic lateral sclerosis (ALS), muscular dystrophy, multiple
CC   sclerosis, myasthenia gravis, or Binswanger's disease. The subject in
CC   need of nervous tissue regeneration has one or more damaged neurons. The
CC   damage to the neurons are caused by vascular lesions of the brain and
CC   spinal chord, trauma to the brain and spinal chord, cerebral haemorrhage,
CC   intracranial aneurysms, hypertensive encephalopathy, subarachanoid
CC   haemorrhage or developmental disorders. The developmental disorder is a
CC   disorder of the brain or spinal cord e.g. congenital hydrocephalus or
CC   spina bifida. The present sequence is a PCR primer used to genotype mice
CC   which are transgenic for the P0/deltaSCIP construct

PT   Inhibitor for treating cancer, is active on allelic form of conditionally
PT   essential gene which has two alternative alleles in a population, and
PT   targets alternative alleles.
XX
PS   Disclosure; Fig 2; 47pp; English.
XX
CC   The invention relates to an inhibitor which is active on an allelic form
CC   of a conditionally essential gene (CEG) comprising at least two
CC   alternative alleles in a population, and where the inhibitor targets at
CC   least one but less than all of the alternative alleles. Also included
CC   are: (1) a method of identifying an inhibitor potentially useful for
CC   treatment of cancer, where the inhibitor is active on CEG, and where the
CC   gene is subject to loss of heterozygosity in a cancer, involves
CC   determining at least two alleles of the gene, testing potential allele
CC   specific inhibitor (AI) to determine whether potential AI is active on
CC   alleles; (2) identifying a potential patient for treatment with an
CC   inhibitor active on alleles of CEG, where the patient is suffering from
CC   cancer, involves: (a) identifying a patient heterozygous for the gene, or
CC   (b) determining whether cancer cells in the patient have undergone loss
CC   of heterozygosity (LOH) of the gene; (3) a nucleic acid probe of at least
CC   12 nucleotides in length which is perfectly complementary to a portion of
CC   a first allelic form of CEG (but not a second), where the portion
CC   comprises a sequence variance site; and (4) selecting a patient for
CC   treatment with an antiproliferative treatment, or selecting an
CC   antiproliferative treatment for a patient suffering from a cancer,
CC   involves determining whether normal somatic cells in a potential patient
CC   are heterozygous for an essential or CEG (which reduces the sensitivity
CC   of the cells to antiproliferative treatment), where a first allelic form
CC   of the gene is more active than a second allelic form, and determining
CC   whether cancer cells of the patient have only the second allelic form of
CC   the gene, where if the somatic cells are heterozygous and the cancer
CC   cells have only the second allelic form, it is indicative that the
CC   patient is suitable for treatment with the antiproliferative treatment or
CC   the antiproliferative treatment is suitable for the patient. The methods
CC   of the invention are useful for preventing development of cancer in a
CC   patient having a precancerous condition, for treating a patient suffering
CC   from a cancer, where the patient is heterozygous for CEG, for inhibiting
CC   growth of a cell (involves subjecting the cell to conditions such that
CC   the gene is essential, and administering at least one inhibitor active on
CC   an allele of CEG). The method inhibits proliferation or kills cells which
CC   have undergone LOH of genes that are not inhibited by the drug and
CC   contain only an allelic form of the essential gene, its RNA transcript,
CC   or its protein product against which the inhibitor is targeted, under the
CC   appropriate altered conditions, recognises more than one linked sequence
CC   variances within a specific allele, and discriminates between two allelic
CC   forms due to a particular single sequence variance between allelic forms
CC   of the target gene. The present sequence shows the sequence surrounding a
CC   polymorphism in an allele of the target gene, glutamate-ammonia ligase

PT   Treating a neuropilin-mediated disease in a mammal, e.g. cancer, injury
PT   to the nervous system, rheumatoid arthritis, or a developmental anomaly,
PT   comprises administering a T2-tryptophanyl-tRNA synthetase or its
PT   derivative.
XX
PS   Example 5; Page 32; 59pp; English.
XX
CC   The sequences given in ABQ80005-10 form siRNA duplexes which were used to
CC   interfere with suppression of NRP-1 expression. T2-tryptophanyl- tRNA
CC   synthetase (T2-TrpRS) was used in a method for identifying an antagonist
CC   to neuropilin. The method comprises designing molecules that are expected
CC   to bind to a neuropilin based on the chemistry and three-dimensional
CC   structure of neuropilin and the chemistry and three-dimensional structure
CC   of T2-TrpRS, contacting the molecules with neuropilin in an in vitro or
CC   cellular assay, and identifying which molecules bind to neuropilin. There
CC   is a specific interaction between T2-TrpRS and neuropilin and this
CC   binding inhibits VEGF-mediated activity. The method and T2-TrpRS or its
CC   derivative are useful for treating a neuropilin-mediated disease in a
CC   mammal, such as cancer (e.g. lung, colon, breast, or prostate cancer),
CC   injury to the nervous system, rheumatoid arthritis, or a developmental
CC   anomaly. The method is useful for identifying an antagonist to
CC   neuropilin. This duplex is targeted at the a1 region of human Nrp-1

```

```
PT   spatial relationship of cosmid, esp. for mammalian chromosomes.
XX
PS   Example 4; Page 74; 128pp; English.
XX
CC   Sequences were determined from the ends of chromosome 11-specific cosmids
CC   by automated sequencing without intermediate subcloning. A sample of 371
CC   DNA sequence fragments were determined and of these, 277 were suitable
CC   for STS primer prediction by computer analysis (using the "Primer"
CC   program available from E.Lander, MIT). The STSs and cosmids were mapped
CC   by in situ hybridisation, somatic cell hybrid analysis or both. Using
CC   this method, 370 STSs specific for human chromosome 11 were generated and
CC   most of them were regionally mapped. This procedure illustrates a novel
CC   method for sequencing complex genomes, designated "sequence sampled
CC   mapping". The sequence sampled mapping method is useful for the
CC   completion of high density sequence-based maps, and ultimately, for the
CC   complete sequencing of genomic DNA directly from cosmid clones. See
CC   AAQ82001-Q82706 for STS primers. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT New human cathepsin Y protein, a gene encoding it and its application.
XX
PS Example 2; Page 31; 48pp; Japanese.
XX
CC The invention relates to human cathepsin Y (AAB11960) and to nucleic
CC acids encoding it. The cDNA (AAA72028) encoding cathepsin Y was derived
CC from ESTs (expressed sequence tags). The gene encoding cathepsin Y is
CC located on chromosome 11q13. Cathepsin Y, like other cathepsins, has
CC cysteine protease activity. The invention also relates to vectors and
CC transformants comprising human cathepsin Y nucleic acid sequences, anti-
CC cathepsin Y antibodies (particularly monoclonal antibodies), and methods
CC and kits for screening potential modulators of cathepsin Y activity.
CC Cathepsin Y, fragments thereof, cathepsin Y nucleotides and cathepsin Y
CC antibodies can be used to study the mechanisms by which various diseases
CC develop. Diseases which may be studied include Alzheimer's disease,
CC pneumonectasis, rheumatoid arthritis, myodystrophy, osteoporosis,
CC neurodegenerative diseases and invasion and metastasis of cancers.
CC Cathepsin Y antibodies and hybridisation probes may also be used for the
CC detection and diagnosis of cancer. Sequences AAA72031-A72032 represent
CC PCR primers used in an exemplification of the invention to amplify human
CC cathepsin Y cDNA

XX
CC The present invention relates to new NOVX polypeptides. The invention is
CC useful for treating or preventing a NOVX-associated disorder such as
CC cardiomyopathy or atherosclerosis, where the disorder is related to cell
CC signal processing and metabolic pathway modulation in a subject,
CC preferably human. The invention is also useful for treating metabolic
CC disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative
CC disorders (e.g. Alzheimer's disease, Parkinson's disease), immune
CC disorders, haematopoietic disorders and various cancers. The molecules of
CC the invention are also useful for treating or preventing cirrhosis,
CC pancreatitis, learning and memory defects, infertility, congenital heart
CC defects, acne, hair growth, pigmentation disorders, endocrine disorders,
CC respiratory disease, gastro-intestinal diseases, reproductive, health,
CC neurological diseases, bone marrow transplantation, endocrine diseases,
CC allergy and inflammation, nephrological disorders, urinary system
CC disorders, neuropsychiatric disorders and age-related disorders. The
CC present nucleic acid sequence represents a PCR primer that was used in
CC the methods of the invention to amplify NOVX proteins

PT Characterizing a metabolic phenotype for an immunosuppressant agent,
PT comprises administering a probe substrate specific to a metabolic pathway
PT of the determinant and detecting metabolites of the pathway.
XX
PS Disclosure; Page 79; 225pp; English.
XX
CC The invention relates to characterising a multi-determinant metabolic
CC phenotype (P) for an immunosuppressant agent. The method involves: (a)
CC administering to an individual a probe substrate specific to a metabolic
CC pathway for an immunosuppressant agent; (b) detecting metabolites of MPs
CC in a biological sample from the individual; and (c) characterizing
CC respective phenotypic determinants of (P). The method is useful for
CC characterizing a multi-determinant metabolic phenotype for an
CC immunosuppressant agent such as cyclosporine, Tacrolimus (RTM),
CC Sirolimus, Prednisone, Cellcept (RTM) and OKT3. (P) can be used to
CC individualize a treatment regimen for an immunosuppressant agent for an
CC individual, by determining (P) of the individual using the method, and
CC determining/selecting a safe and therapeutically effective dose of the
CC immunosuppressant agent for treatment based on (P) of the individual. A
CC new method of genotyping individuals to identify those lacking an allelic
CC variation known to prompt toxicity of the immunosuppressant agent, and
CC characterizing (P) of the identified individual to determine each
CC individual's ability to metabolize the immunosuppressant agent is also
CC provided. This is useful for identifying those individuals at high risk
CC for serious adverse events. The present sequence represents an allele-
CC specific primer used for genotyping the N-acetyltransferase (NAT1) gene,
CC by amplifying NAT1*14 allele

PT Characterizing multi-determinant metabolic phenotypes of N-(aryl
PT substituted)-naphthalidimide compounds, useful for individualizing
PT therapy with amonafide, comprises determining metabolic phenotype from
PT detected metabolites.
XX
PS Disclosure; Page 89; 351pp; English.
XX
CC The invention relates to characterizing a multi-determinant metabolic
CC phenotype for a class of N-(aryl substituted)-naphthalidimide compounds
CC (I) (the phenotypic determinants correspond to respective metabolic
CC characteristics). The method involves (a) administering to an individual
CC a probe substrate specific to metabolic pathway(s) of (I); (b) detecting
CC metabolites of the pathway in a biological sample in response to the
CC probe substrate; and (c) characterizing the determinants of the metabolic
CC phenotype based on detected metabolites. The method is useful for the
CC individualization of treatment with the anticancer drug, amonafide, on
CC the basis of a phenotypic profile of an individual. It may also be used
CC in research and in the development of new drugs. The present sequence
CC represents an allele specific PCR primer for amplifying the NAT1*14
CC allele, used in NAT1 genotyping

PT   Characterizing metabolic phenotype based on phenotypic determinants, by
PT   administering a probe substrate specific to a metabolic pathway of the
PT   determinant and detecting metabolites of pathway in response to
PT   substrate.
XX
PS   Disclosure; Page 78; 268pp; English.
XX
CC   The sequences given in ABA00250-87 are primers which were used in the
CC   method of the invention for characterizing multi-determinant metabolic
CC   phenotype based on a number of phenotypic determinants (PDs). The method
CC   comprises administering to an individual a probe substrate (PS) specific
CC   to a metabolic pathway (MP) of each of the PDs, detecting metabolites of
CC   MPs in a biological sample from the individual in response to PS, and
CC   characterizing respective PDs of metabolic phenotypes based on detected
CC   metabolites. This primer is used in the determination of the N-acetyl
CC   transferase (NAT1) alleles NAT1*4 (wt) and the mutant NAT1*14 (A560G).
CC   The first PCR reaction produces a 175 bp fragment which when incubated
CC   with BsaI is cleaved in the presence of NAT1*4, but NAT1*14 is uncleaved.
CC   The NAT1*14 allele is confirmed using the second PCR reaction. Knowledge
CC   of the metabolic phenotype is useful for determining a combination drug
CC   therapy where an individual's phenotype is indicative of a fast
CC   metabolizer, and a corresponding inhibitor is selected for combined
CC   treatment with a drug to improve the therapeutic effect in the
CC   individual. The method of the invention is useful for diagnosing a
CC   disease or condition associated with altered function in a drug
CC   metabolizing enzyme. It is also useful for selecting a treatment for an
CC   individual corresponding to the individual's metabolic phenotype and for
CC   screening a number of individuals for participation in a drug treatment
CC   trial assessing the therapeutic effect of a candidate drug treatment

PT   Use of genotyping for the individualization of therapy and/or treatment,
PT   and the individual is genotype for a specific metabolic factor and a
PT   corresponding genotypic determinant is characterized.
XX
PS   Disclosure; Page 35; 147pp; English.
XX
CC   The invention relates to the use of genotyping for the individualization
CC   of therapy and/or treatment, where an individual is genotype for a
CC   specific metabolic factor and a corresponding genotypic determinant is
CC   characterized. The method is useful for the individualization of therapy
CC   and/or treatment, for quantifying an individualized dosage regime of a
CC   drug, and to identify an individual having a metabolic incompatibility
CC   with a selected therapy and/or treatment. The method is useful for the
CC   individualization of drug dosing, to identify individuals having a
CC   particular allelic variation known to influence the ability to
CC   effectively metabolize a given drug or class of drugs, to characterize a
CC   metabolic determinant and identify an individualized dosage for a given
CC   drug treatment regime, and for identifying those individuals who is at
CC   risk for a particular drug treatment regime. The method quickly and
CC   accurately determines phenotypic determinants for the CYP3A4 or CYP2D6
CC   metabolic pathway. Sequences ABZ75813-815 represent PCR primers for
CC   genotyping the NAT1 determinants

CC   The invention relates to a method of characterisation of a multi-
CC   determinant metabolic phenotype for at least one antibiotic agent. The
CC   method involves administering a probe substrate specific to metabolic
CC   pathways for antibiotic agents; detecting metabolites of the metabolic
CC   pathways in response to the probe substrate and characterising respective
CC   phenotypic determinants of the metabolic phenotype based on detected
CC   metabolites. The method is used for characterisation of multi-determinant
CC   metabolic phenotype for at least one antibiotic agent, useful for
CC   treating an individual having a condition treatable with at least one
CC   antibiotic agent with individualisation of the treatment and for
CC   selecting an individual treatment regime. The invention is useful in
CC   research and drug development. The present sequence is NAT1 (N-
CC   acetyltransferase) 1 allele specific PCR primer, used to illustrate the
CC   method of the invention

CC The present invention relates to the characterisation of a multi-
CC determinant metabolic phenotype. This comprises: (a) administering to an
CC individual a probe substrate specific to metabolic pathway(s) for
CC antiarrhythmic agent(s); (b) detecting metabolites of the metabolic
CC pathway(s) in response to the probe substrate; and (c) characterising
CC respective phenotypic determinants of the multi-determinant metabolic
CC phenotype based on detected metabolites. This useful for treating an
CC individual having a condition treatable with at least one antiarrhythmic
CC agent with individualisation of the treatment and for selecting an
CC individual treatment regime. The present sequence is a PCR primer used to
CC identify an individual's metabolic phenotype

PT Characterizing multi-determinant metabolic phenotype for Alzheimer's
PT disease agent, involves administering probe substrate specific to
PT metabolic pathway of agent and detecting metabolites in response to
PT substrate.
XX
PS Disclosure; Page 91; 251pp; English.
XX
CC PCR primers ABZ23145-47 were used to amplify a 175 bp fragment of the
CC human N-acetyltransferase-1 (NAT1) gene. Restriction analysis of the
CC amplified fragment allowed the identification of the mutant and wild type
CC alleles. Drugs which are affected by the NAT1 pathway are used to treat
CC Alzheimer's disease. The specification describes a method for
CC characterizing the multi-determinant metabolic phenotype for at least one
CC Alzheimer's disease agent. The method comprises administering a probe
CC substrate specific to metabolic pathway(s) for the Alzheimer's disease
CC agent, detecting metabolites of the pathway(s) in a sample in response to
CC the substrate and characterizing phenotypic determinants of the metabolic
CC phenotype based on detected metabolites. The method is useful for
CC characterizing a multi-determinant metabolic phenotype for at least one
CC Alzheimer's disease agent such as acetylcholinesterase inhibitor,
CC nicotinic compound, gamma secretase inhibitor and M2 antagonist,
CC especially donezepil. The multi-determinant metabolic phenotype is
CC comprised of at least one determinant indicative of an individual's
CC metabolic capacity for at least one drug metabolizing enzyme, such as N-
CC acetyltransferase-1 (NAT1), NAT2, CYP1A2, CYP2D6, CYP2A6, CYP2E1, CYP2C9,
CC CYP2C19, UGTs, GSTs, and STs, preferably CYP3A4. The method is useful to
CC individualize a treatment regimen for at least one Alzheimer's disease
CC agent

PT Characterizing a metabolic phenotype for an antidepressant agent,

PT comprises administering a probe substrate specific to a metabolic pathway
PT of a determinant and detecting metabolites of the pathway.
XX
PS Disclosure; Page 82; 225pp; English.
XX
CC The specification describes a method for characterizing a multi-
CC determinant metabolic phenotype for an antidepressant agent. The method
CC comprises administering to an individual a probe substrate specific to a
CC metabolic pathway for an antidepressant agent; detecting metabolites of
CC the metabolic pathway in a sample from the individual in response to the
CC probe substrate; and characterizing respective phenotypic determinants of
CC the phenotype based on detected metabolites. The method is useful for
CC characterizing a multi-determinant metabolic phenotype for an
CC antidepressant agent such as tricyclic antidepressants, selective
CC serotonin reuptake inhibitors, monoamine oxidase inhibitors,
CC psychostimulants and atypical (or nontricyclic) antidepressants. The
CC present PCR primer (ABV72578) was used to determine the presence of the N
CC -acetyltransferase 1 (NAT1) allele NAT1*14, comprising the A560G
CC mutation. The primers were used in the method of the invention for
CC indirect phenotyping (genotyping) of NAT1

XX
CC The invention relates to characterising method for a multi-determinant
CC metabolic phenotype for a gastroesophageal reflux disease (GERD) agent.
CC The method involves administering to a subject a probe substrate specific
CC to metabolic pathway(s) for a GERD agent and detecting metabolites of the
CC pathway(s) in a sample from the subject in response to the substrate. The
CC method is useful for characterising a multi-determinant metabolic
CC phenotype for at least one GERD agent such as H_2-receptor antagonists,
CC promotility agents and proton pump inhibitors. The multi-determinant
CC metabolic phenotype is comprised of at least one determinant indicative
CC of an individual's metabolic capacity for at least one drug metabolising
CC enzyme, such as N-acetyltransferase-1 (NAT-1), NAT-2, CYP1A2, CYP2D6,
CC CYP2A6, CYP2E1, CYP2C9, CYP2C19, UGTs, GSTs, and STs, preferably CYP3A4.
CC The characterising method is useful to individualise a treatment regimen
CC for at least one GERD agent for an individual. This polynucleotide
CC sequence represents a PCR primer used in the characterising method of the
CC invention

PT Characterizing metabolic phenotype for antineoplastic agent, based on
PT phenotypic determinants, by administering probe substrate specific to
PT metabolic pathway of determinant and detecting metabolites of pathway.
XX
PS Disclosure; Page 247; 251pp; English.
XX
CC The invention relates to a method of characterizing a multi-determinant
CC metabolic phenotype for an antineoplastic agent. The method involves
CC administering to an individual a probe substrate specific to a metabolic
CC pathway for an antineoplastic agent, detecting metabolites of metabolic
CC pathway in a biological sample from the individual in response to probe
CC substrate, and characterising respective phenotypic determinants of
CC metabolic phenotype based on detected metabolites. The method is useful
CC for characterising a multi-determinant metabolic phenotype for an
CC antineoplastic agent such as taxanes, estrogen antagonists, camptothecin
CC derivatives, anthracyclines, alkylating agents, podophyllotoxins, vinca
CC alkaloids, receptor tyrosine kinase inhibitors, nitrosureas, platinum
CC analogues and antimetabolites. The present sequence is N-acetyl
CC transferase (NAT)1 allele specific PCR primer used to illustrate the
CC method of the invention

XX
CC   The specification describes a method for characterizing a multi-
CC   determinant metabolic phenotype for a erectile dysfunction (ED) agent.
CC   The method comprises administering to a subject a probe substrate
CC   specific to the metabolic pathway(s) for an ED agent; detecting
CC   metabolites of the pathway(s) in a sample from the subject in response to
CC   the substrate; and characterizing respective phenotypic determinants of
CC   the multi-determinant metabolic phenotype. The method is useful for
CC   characterizing a multi-determinant metabolic phenotype for an ED agent
CC   such as a phosphodiesterase 5 (PDE5) inhibitor, in particular sildenafil
CC   Viagra (RTM). The multi-determinant metabolic phenotype is comprised of a
CC   determinant indicative of an individual's metabolic capacity for a drug
CC   metabolizing enzyme, such as N-acetyltransferase-1 (NAT-1), NAT-2,
CC   cytochrome P450 (CYP)1A2, CYP2D6, CYP2A6, CYP2E1, CYP2C9, CYP2C19, UDP-
CC   glucuronosyltransferase (UGT)s, glutathione-S-transferase (GST)s, and
CC   stromelysin (ST)s, preferably CYP3A4. PCR primers ABZ23433-35 were used
CC   to amplify fragments of the NAT-1 gene. The amplified fragment was
CC   analysed by restriction analysis to identify the wild type and mutant
CC   alleles. The primers were used for indirect phenotyping (genotyping) of
CC   NAT-1, in the course of the invention

PT Characterizing metabolic phenotype for analgesic, based on phenotypic
PT determinants, by administering probe substrate specific to metabolic
PT pathway of determinant and detecting metabolites of pathway.
XX
PS Disclosure; Page 96; 246pp; English.
XX
CC The present sequence is a primer used with the primer given in ABV76234
CC in an allele-specific PCR to confirm the NAT1*14 allele of an N-
CC acetyltransferase (NAT1) gene. Studies have demonstrated the presence of
CC one wild-type allele and 6 mutant alleles of NAT1. NAT1 metabolizes
CC several drugs (including the antimalarial dapsone) and dietary
CC constituents, and activates some environmental procarcinogens. It has 2
CC phenotypes: slow and rapid acetylators. The present invention relates to
CC the individualization of therapy, especially of treatment with
CC analgesics, on the basis of a phenotyping profile of an individual. In
CC the case of NAT1, an example of indirect phenotyping (genotyping)
CC involves the PCR amplification of a 175 bp fragment which includes an
CC A560G mutation, using the present primer and the primer given in
CC ABV76235. The 175 bp fragment is incubated with BsaI. The wild-type
CC allele produces fragments of 155 and 20 bp, whereas mutant allele NAT1*14
CC is uncleaved

XX
CC The present sequence is a primer for the PCR amplification of the N-
CC acetyltransferase (NAT1) gene. NAT1 activity varies broadly in a given
CC population. The NAT1*4 genotype is associated with slow drug metabolizers
CC and is found at a frequency of 50%, 30% and 35% in Indian, Malaysian and
CC Chinese populations, respectively. The NAT1*4 (wild-type) and the mutant
CC NAT1*14 alleles can be determined by PCR-RFLP of a fragment of the gene
CC containing an A560G mutation. PCR is performed with the primers fiven in
CC ACF05571 and ACF05572. The 175 bp product is incubated with BsaI. The
CC Nat1*1 allele produces 155 and 20 bp fragments, while the mutant NAT1*14
CC is uncleaved. The NAT1*14 allele is confirmed using the present primer
CC with the primer given in ACF05571. The present invention provides a
CC method for using multi-determinant phenotyping for the individualization
CC of treatment with an antihistamine, especially where the multi-
CC determinant phenotype is comprised of a determinant indicative of an
CC individual's metabolic capacity for a drug metabolizing enzyme such as
CC NAT1. The method involves administering a probe substrate specific to the
CC metabolic pathway of the antihistamine and detecting metabolites in
CC response to the substrate

PT Characterizing multi-determinant metabolic phenotype for an antiviral
PT agent, by administering a probe substrate specific to metabolic pathway
PT of the antiviral agent and detecting metabolites in response to
PT substrate.
XX
PS Disclosure; Page 88; 256pp; English.
XX
CC The present invention describes a method (M1) for characterising the
CC multi-determinant metabolic phenotype (MP) for at least one antiviral
CC agent (I), which involves administering to a subject, a probe substrate
CC specific to metabolic pathway(s) for (I), detecting metabolites of the
CC pathway(s) in a sample from the subject in response to the substrate, and
CC characterising respective phenotypic determinants of MP based on detected
CC metabolites. (I) has virucide activity. (M1) is useful for characterising
CC a multi-determinant metabolic phenotype for at least one antiviral agent
CC such as nucleoside analogue reverse transcriptase inhibitor (NRT1), non-
CC nucleoside reverse transcriptase inhibitor (NNRT1), a protease inhibitor
CC (PI), an immune response modifier, preferably ritonavir. The multi-
CC determinant metabolic phenotype is comprised of at least one determinant
CC indicative of an individual's metabolic capacity for at least one drug
CC metabolising enzyme, such as CYP3A4, or chosen from N-acetyltransferase-1
CC (NAT-1), NAT-2, CYP1A2, CYP2D6, CYP2A6, CYP3A4, CYP2C9, CYP2C19, UGTs,
CC GSTs and STs. (M1) is useful to individualise a treatment regimen for at
CC least one antiviral agent compound for an individual. The method quickly
CC and accurately determines phenotypic determinants for the metabolic
CC pathways of drug metabolising enzymes, and avoids the severe side effects
CC and frustration that accompany trial and error treatment. The present
CC sequence represents a PCR primer for amplifying a NAT-1 mutant, which is
CC used in the exemplification of the present invention

XX
CC The present sequence is that of a quadruplex structure-forming DNA
CC sequence from the nuclease hypersensitivity element (NHE) in the
CC regulatory regions of the human RET gene. Certain mutations in quadruplex
CC forming nucleotides sequences have been shown to destabilise quadruplex
CC structure and are associated with cancer. Methods are provided for
CC identifying quadruplex nucleotide sequences having destabilising guanine
CC substitutions, for determining whether a subject is at risk of developing
CC or having cancer, pharmacogenomic methods for targeting appropriate
CC prevention or therapeutic regiments, methods for screening molecules that
CC interact with stabilised and destabilised quadruplexes, and therapeutic
CC methods for treating cancers, such as antisense nucleic acid cancer
CC therapy that specifically targets DNA in subjects having a quadruplex-
CC destabilising mutation.

PT   Identifying extendible primers for use in identification, or
PT   classification of a nucleic acid of an organism, allele or gene such as
PT   class 1/2 HLA comprises identifying all possible nucleotide sequences of
PT   specific length.
XX
PS   Claim 14; Page 49; 66pp; English.
XX
CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PT   Functional nucleic acids targeting NS3 protease and/or helicase of
PT   hepatitis C virus (HCV) for prevention, diagnosis and treatment of
PT   hepatitis C.
XX
PS   Example 1; SEQ ID NO 26; 22pp; Japanese.
XX
CC   This invention relates to novel nucleic acids targeting the NS3 protease
CC   and/or helicase of hepatitis C virus (HCV). The invention provides RNA
CC   molecules having a base sequence with a structure given in the
CC   specification and capable of inhibition of NS3 protease and/or helicase
```

```
CC   of HCV, and capable of forming a secondary structure also given in the
CC   specification. The invention is useful for the effective prevention,
CC   diagnosis and treatment of hepatitis C. The present sequence is that of a
CC   PCR primer which was used during the exemplification of the invention.

PT Sequential consensus region-directed amplification for sorting mixture of
PT DNAs into 2 or more subsets or distinguishing gene expression patterns in
PT 2 samples, useful for disease diagnosis and gene analysis.
XX
PS Example; Fig 1C; 19pp; English.
XX
CC The invention relates to a method of sequential consensus region-directed
CC amplification for sorting a mixture of DNAs into 2 or more subsets or
CC distinguishing gene expression patterns in 2 samples. The methods, kits
CC and oligonucleotides are useful for sorting a mixture of DNAs into 2 or
CC more subsets or distinguishing gene expression patterns in 2 samples e.g.
CC for disease diagnosis and gene analysis. The present sequence is oligo dT
CC PCR primer used to illustrate the method of the invention

PT Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT using novel nucleic acid mols. as primers.
XX
PS Disclosure; Col 11-12; 186pp; English.
XX
CC The invention relates to the isolation of polymorphic repeat sequences
CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC repeats, especially for use in e.g paternity or maternity testing, human
CC genetic analysis such as linkage analysis of genetic disease, commercial
CC animal or plant breeding or pedigree analysis. Clones containing the
CC repeat sequences were isolated by hybridisation of chromosome-specific
CC phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR
CC amplify the inserts from the isolated clones containing the repeat
CC sequences. The primers AAT65892-3 were used to amplify the repeat
CC sequence marker clone Mfd48 (AAT65748). (Updated on 25-MAR-2003 to
CC correct PF field.)

PT   differentiation.
XX
PS   Claim 15; Page 212; 223pp; English.
XX
CC   This sequence represents a microsequencing primer for a biallelic marker
CC   from the retinoblastoma binding protein-7 (RBP-7) genomic sequence
CC   (AAZ86967) of the invention. The RBP-7 coding sequence and regulatory
CC   sequences are useful for the recombinant production of the protein and
CC   for expressing heterologous nucleic acids. Primers and probes derived
CC   from the RBP-7 nucleotide sequence (such as this sequence) are useful for
CC   DNA amplification and detection methods. RBP-7 biallelic markers (see
CC   AAZ86993-Z87034) are useful for diagnosis of disease related to
CC   alteration in the regulation or in the coding regions of the RBP-7 gene
CC   and for prognosis/diagnosis of an eventual treatment with therapeutic
CC   agents, especially agents acting on pathologies involving abnormal cell
CC   proliferation and/or differentiation, these include thyroid hyperplasia,
CC   psoriasis, benign prostate hypertrophy, cancers, including breast cancer,
CC   sarcomas and other neoplasms, bladder cancer, colon cancer, lung cancer,
CC   prostate cancer, various leukaemias, and lymphomas. RBP-7 antibodies are
CC   useful as diagnostic agents

PT   Diagnosing a subject at the risk for or having Alzheimer's disease
PT   comprises determining at least one single nucleotide polymorphism in
PT   mitochondrial DNA associated with the disease in the sample from the
PT   subject.
XX
PS   Example 9; Page 52; 89pp; English.
XX
CC   The present invention describes a novel method for determining the risk
CC   of or diagnosing Alzheimer's disease using single nucleotide
CC   polymorphisms (SNPs) present in an individual's mitochondrial DNA
CC   (mtDNA). In additon, the SNPs identified can be used to identify agents
CC   suitable for use in treating Alzheimer's disease. Sequences AAC67301-
CC   C67610 are PCR primers used to demonstrate the method of the invention

PT   Double stranded DNA synthesis with specific orientation comprises
PT   synthesizing a first strand of DNA complementary to a selected DNA or RNA
PT   template and synthesizing second strand complementary to first one.
XX
PS   Example 1; Fig 1; 14pp; English.
XX
CC   The present invention describes an improved method of DNA synthesis which
CC   provides double stranded DNA where the predetermined orientation of the
CC   sequence is preserved. This can be used in the construction of
CC   complementary DNA and directional DNA libraries

CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing
CC   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC   scar. AAH57577 to AAH62099 represent sequences used in the

PT   Probes for detecting target nucleotide sequence in sample, has sequence
PT   that forms hairpin structure having a double-stranded segment and single-
PT   stranded loop collectively forming region complementary to target
PT   sequence.
XX
PS   Example 4; Page 49; 72pp; English.
XX
CC   The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
CC   AGT02012. This is one of a set of oligonucleotides (see ABA91527-30) used
CC   to assess the minimum number of ribonucleotides in DNA-RNA chimeric
CC   oligonucleotides required for RNase H cleavage. Each oligonucleotide of
CC   the set had a different number of ribonucleotides, 3 in the present case.
CC   The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
CC   (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
CC   minutes. The results showed that 4 ribonucleotides were the minimum
CC   number for RNA cleavage. The invention provides probes for nucleic acid
CC   hybridisation. The probes form a hairpin structure comprising a double-
CC   stranded stem and a single-stranded loop, and are capable of both
CC   intramolecular and intermolecular hybridisation. The double-stranded stem
CC   may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
CC   RNase H cleavage. When the probe hybridises with a target DNA, the RNA
CC   strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and
CC   can be removed. Arrays and methods for nucleic acid hybridisation using
CC   the probes are provided

PT   Probes for detecting target nucleotide sequence in sample, has sequence
PT   that forms hairpin structure having a double-stranded segment and single-
PT   stranded loop collectively forming region complementary to target
PT   sequence.
XX
PS   Example 4; Page 49; 72pp; English.
XX
CC   The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
CC   AGT02012. This is one of a set of oligonucleotides (see ABA91527-30) used
CC   to assess the minimum number of ribonucleotides in DNA-RNA chimeric
CC   oligonucleotides required for RNase H cleavage. Each oligonucleotide of
CC   the set had a different number of ribonucleotides, 3 in the present case.
CC   The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
CC   (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
CC   minutes. The results showed that 4 ribonucleotides were the minimum
CC   number for RNA cleavage. The invention provides probes for nucleic acid
CC   hybridisation. The probes form a hairpin structure comprising a double-
CC   stranded stem and a single-stranded loop, and are capable of both
CC   intramolecular and intermolecular hybridisation. The double-stranded stem
CC   may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
CC   RNase H cleavage. When the probe hybridises with a target DNA, the RNA
CC   strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and
CC   can be removed. Arrays and methods for nucleic acid hybridisation using
CC   the probes are provided

PT Screening protease/protease inhibitor gene library for gene encoding the
PT same, by constructing host cell having the gene, cultivating cell,
PT dissociating complex formed between them, selecting protein and isolating
PT gene.
XX
PS Example 1; Page 46; 54pp; English.
XX
CC The invention relates to a method for screening a protease/protease
CC inhibitor gene library for a gene encoding a protease of interest. The
CC method comprises introducing a first gene of the protease gene library
CC and a second gene encoding a protease inhibitor into a host cell;
CC cultivating the host cell, wherein the cell expresses the first and the
CC second genes to produce a complex of a protease and the inhibitor;
CC dissociating the inhibitor from the complex and selecting the protease of
CC interest and isolating the encoding gene. A complex may be used for a
CC number of industrial applications, in particular within the detergent
CC industry, thus, relates to a cleaning or detergent composition,
CC preferably a laundry or dishwash composition comprising the complex,
CC where hand or machine laundry detergent composition including a laundry
CC additive composition suitable for pre-treatment of stained fabrics and a
CC rinse added composition, or be formulated as a detergent composition for
CC use in general household hard surface cleaning operations or be
CC formulated for hand or machine dish washing operations. The present
CC sequence is a PCR primer used for amplifying barley chymotrypsin
CC inhibitor CI-2A gene used in the exemplification of the invention

PT Producing protease-inhibitor compositions with reduced allergenicity,
PT stability and activity for use in detergent compositions.
XX
PS Example 1; Page 44; 52pp; English.
XX
CC The invention provides a method for producing a protease-inhibitor
CC complex with reduced allergenicity for use in detergents. The method
CC involves (a) constructing a fusion polynucleotide sequence in frame, the
CC sequence comprising a first gene encoding a protease (preferably a
CC subtilase S11 or S12) and a second gene encoding a protease inhibitor;
CC (b) introducing the sequence into a host cell; and (c) cultivating the
CC host cell (the host cell expresses the sequence an produces a non-
CC covalently linked complex of the protease and the inhibitor). The
CC protease-inhibitor complex produced by the method may be used as an
CC additive in detergent compositions. Sequences ABL40485-497 represent PCR
CC primers used in the construction of expression cassettes for simultanoeus
CC expression of the apr gene encoding subtilisin 309 or savinase from
CC Bacillus lentus and the chymotrypsin inhibitor, CI-2A from barley

PT Detecting the presence or absence of an allelic variant of a polymorphic
PT region of COX6B and/or GPI-1 gene, useful for detecting a predisposition
PT to high serum cholesterol, low serum HDL and cardiovascular disease.
XX
PS Disclosure; Page 33; 199pp; English.
XX
CC The invention comprises methods of detecting the presence or absence of
CC at least one allelic variant of a polymorphic region of a gene associated
CC with cardiovascular disease. The invention specifically relates to
CC detecting the region of a cytochrome C oxidase subunit VIb (COX6B) gene
CC that is associated with high serum cholesterol, or the region of the N-
CC acetylglucosaminyl transferase component glycosylphosphatidylinositol-1
CC (GPI-1) gene that is associated with low serum high density lipoprotein
CC (HDL). The methods of the invention are useful for detecting a
CC predisposition to high serum cholesterol, low serum HDL and
CC cardiovascular disease. The methods are also useful for elucidating
CC pathological pathways, developing diagnostic assays and new drug
CC therapies for such disorders. The present DNA sequence represents a PCR
CC primer used to amplify a human gene that is associated with high serum
CC cholesterol, low serum HDL and/or cardiovascular disease

PT Determining single nucleotide polymorphisms in mDNA or homoplasmic mDNA
PT mutations, useful for diagnosing and treating diseases, such as
PT Alzheimer's disease, cancer and type 2 diabetes mellitus.
XX
PS Example 2; SEQ ID NO 618; 193pp; English.
XX
CC The present invention describes a method (M1) for determining the
CC mitochondrial haplogroup of a subject, comprising determining in a
CC biological sample with mitochondrial DNA (mtDNA) from a subject, the
CC presence or absence of at least one mitochondrial single nucleotide
CC polymorphism (SNP) that is associated with a mitochondrial haplogroup.
CC Also described: (1) determining a genetic relationship between two
CC subjects; (2) determining a genetic relationship between an unknown
CC source or biological subject from which an unidentified sample is
CC obtained, and a known source or biological subject from an identified
CC sample is obtained; and (3) determining the presence of or the risk of
CC having a disease associated with a mtDNA SNP. Mitochondrial DNA can have
CC antidiabetic, nootropic, neuroprotective and cytostatic activities, and
CC can be used in gene therapy. M1 and compositions of the present invention
CC are useful for detecting the presence or risk of diseases, treating such
CC diseases, determining the haplogroup of an individual, and establishing
CC genetic relationships between individuals for genealogical and forensic
CC purposes. The diseases include Alzheimer's disease, cancer and type 2
CC diabetes mellitus. The present sequence represents a PCR primer used in
CC the amplification of human mtDNA in an example from the present
CC invention.

XX
PS Example 3; SEQ ID NO 111; 145pp; English.
XX
CC The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human c-fos gene by RNA interference. The
CC siNAs may or may not comprise ribonucleotides and may be double or single
CC stranded. They further comprise sense and antisense regions, or
CC alternatively are assembled from a sense oligonucleotide and an antisense
CC oligonucleotide. Specifically, the siNAs include short interfering RNA
CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA
CC (shRNA). The siNAs can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC of siNA; and vectors that express siNA. The siNAs are used to modulate
CC expression of the c-fos gene in cells, tissue explants or organisms

CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC treatment of a variety of conditions. They may be used for treating
CC central nervous system lesions and injuries (e.g., Alzheimer's disease,
CC Parkinson's disease, Huntington's disease, epilepsy, dementia or
CC amyotrophic lateral sclerosis); various cancers; other proliferative
CC diseases (e.g., restenosis and polycystic kidney disease); inflammatory
CC and/or allergic diseases; viral infections (including HIV infection);
CC autoimmune diseases; and transplant rejection. The siNAs are also useful
CC for drug screening, diagnosis, therapeutic target identification and
CC validation, genetic engineering, pharmacogenomics, studying gene
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC The present sequence represents the upper strand of a human c-fos-
CC targeted double-stranded siNA, which is identical to the c-fos transcript
CC target sequence.

XX
CC The present invention describes a short interfering nucleic acid (siNA)
CC that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC by RNA interference. Also described: (1) modulating expression of SCD
CC genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC virucide activities. The siNAs can be used to modulate expression of SCD
CC genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC diabetes (types I and II); atherosclerosis; cancer and viral infections.
CC They can also be used for drug screening; diagnosis; target
CC identification and validation; genetic engineering; pharmacogenomics;
CC studying gene function and gene mapping (e.g. of single-nucleotide
CC polymorphisms). The present sequence represents an SCD siNA, which is
CC used in the exemplification of the present invention.

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 5115; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT A process for purification of oligonucleotides using liquid
PT chromatography.
XX
PS Example 1; Page 4; 13pp; Japanese.
XX
CC The present sequence is an oligonucleotide provided in a specification
CC relating to the simplified purification of oligonucleotides by liquid
CC chromatography. The process comprises: (a) pouring oligonucleotides
CC protected with a hydrophobic group and oligonucleotide with no protective
CC group into a liquid chromatography column packed with an acid and alkali
CC resistant packing agent, such as polystyrene resin; (b) pouring a mixed
CC developing solvent composed of a buffer made from a volatile salt and a
CC water soluble organic solvent at a suitable concentration gradient into
CC the column; (c) pouring an acid, particularly 6-16 v/v% acetic acid, into
CC the column to deprotect the oligonucleotides protected with the
CC hydrophobic group; (d) pouring a mixed developing solvent composed of a
CC buffer made from a volatile salt, particularly 0.05-0.5 N aqueous
CC ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water
CC soluble organic solvent at a suitable concentration gradient to elute the
CC deprotected oligonucleotides; and (e) removal of the solvent and the salt
CC from the eluted oligonucleotides

PT   Probes for detecting target nucleotide sequence in sample, has sequence
PT   that forms hairpin structure having a double-stranded segment and single-
PT   stranded loop collectively forming region complementary to target
PT   sequence.
XX
PS   Example 5; Page 50; 72pp; English.
XX
CC   The present sequence is that of oligonucleotide AGT02025, which contains
CC   a single mismatch with a target DNA oligonucleotide (see ABA91531). It is
CC   one of a set of oligonucleotides (see ABA91532-37) containing
CC   mismatch(es) to the target DNA that were tested in a hybridisation/RNase
CC   H cleavage assay. The results showed that 2 mismatches between the target
CC   and the probe ablated RNase H cleavage. The effect of one mismatch site
CC   was less than that of two mismatch sites, and showed a polarity effect,
CC   with weaker inhibition shown in assays with AGT02021 than in assays using
CC   an oligonucleotide in which the mismatch was at an adjacent position.
CC   Oligonucleotides in which the mismatch was G or C rather than A showed
CC   similar inhibition of RNase H cleavage. The invention provides probes for
CC   nucleic acid hybridisation. The probes form a hairpin structure
CC   comprising a double-stranded stem and a single-stranded loop, and are
CC   capable of both intramolecular and intermolecular hybridisation. The
CC   double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that
CC   is resistant to RNase H cleavage. When the probe hybridises with a target
CC   DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H
CC   treatment and can be removed. Arrays and methods for nucleic acid
CC   hybridisation using the probes are provided

PT   Novel isolated polypeptides useful for diagnosis of prostate cancer.
XX
PS   Claim 18; Page 146; 152pp; English.
XX
CC   The invention describes novel isolated polypeptides (I, Ib) useful for
CC   diagnosing prostate cancer comprising obtaining a patient sample
CC   containing prostate cells and detecting the presence or absence of an
CC   expression product of a HML-2 endogenous retrovirus in a patient sample.
CC   Polynucleotides associated with (I) are useful for diagnosis or treatment
CC   of testicular cancer, multiple sclerosis or insulin-dependent diabetes
CC   mellitus. An inhibitor of a HML-2 protease and a transdominant negative
CC   mutant of HML-2 cORF are also useful in the manufacture of a medicament
CC   for treating prostate cancer. (I) and (Ib) are useful for generating
CC   antibodies specific to the polypeptides associated with cancer, as
CC   targets for therapeutic intervention, and in immunising a transgenic
CC   animal. This sequence represents a probe used for detecting the presence
CC   of human endogenous retrovirus (herv) of the HML-2 sub-group in prostate
CC   tissue

PT   Detecting point mutation in DNA strand, by hybridizing target DNA strand
PT   having mutation with test DNA strand to form duplex, contacting the
PT   duplex with RNase H and determining the cleavage of test strand by RNase
PT   H.
XX
PS   Example 5; Fig 4; 26pp; English.
XX
CC   The invention relates to a novel method for detecting a point mutation in
CC   a DNA strand. The novel method comprises hybridising a target DNA strand
CC   containing or suspected of containing a point mutation with a test
CC   nucleic acid strand complementary to the DNA strand to form a target DNA
CC   strand/test nucleic acid strand duplex, contacting the duplex with an
CC   RNase H, and determining whether the ribonucleotide residues within the
CC   nucleotide sequence are cleaved by RNase H. The method is useful for
CC   detecting a point mutation in a DNA strand, where the point mutation to
CC   be detected is a single nucleotide polymorphism, preferably a
CC   polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian
CC   or human genome. The method is useful to detect any nucleic acids from
CC   any species of organisms such as Acintobacter, Bacillus, Candida,
CC   Enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses.
CC   This polynucleotide sequence represents a ribonucleotide relating to the
CC   mutation detecting method of the invention

XX
PT   Determining whether an individual is predisposed to susceptibility to low
PT   bone mineral density (BMD) and/or bone damage, involves identifying
PT   polymorphisms in associated genes.
XX
PS   Example 8; Page 237; 246pp; English.
XX
CC   The present invention describes a method of determining whether an
CC   individual is predisposed to susceptibility to low bone mineral density
CC   (BMD) and/or bone damage comprising identifying whether the individual
CC   has at least one polymorphism in a polynucleotide encoding a protein,
CC   where the polynucleotide is one of 81 200-500 nucleotide sequences (S1,
CC   see ADC98235 to ADC98315). An agent identified in an method from the
CC   present invention which can be used for the prevention or treatment of a
CC   disease resulting in susceptibility to low BMD and/or bone damage is
CC   useful in the manufacture of a medicament for use in modulating the
CC   susceptibility to low BMD and/or bone damage. The disease associated with
CC   low BMD and/or bone damage is osteoporosis. The present PCR primer
CC   sequence is used in the exemplification of the present invention.

PT   Detection of Aujeszky's disease virus - using specified oligo-nucleotide
PT   as primer for selective detection.
XX
PS   Claim 1; Page 1; 9pp; Japanese.
XX
CC   The detection method for Aujezsky's disease virus uses a primer pair
CC   selected from the ADV DNA-specific region, with PCR designed to suit the
CC   amplification of DNA, thereby permitting specific and highly sensitive
CC   detection of ADV. Claimed primers are given in AAQ51659-72; additional
CC   primers are given in AAQ51673-74

PT   New oligo:nucleotides hybridisable with H-ras or Ki-ras gene nucleic acid
PT   - in normal or mutated form, for detecting or modulating gene expression,
PT   specifically inhibiting proliferation of cancer cells.
XX
PS   Claim 109 and 115; Page 36; 104pp; English.
XX
CC   The sequences given in AAQ62025-38 are antisense phosphorothioate
CC   oligonucleotides which are targetted to various regions of Ki-ras
CC   oncogene. These oligonuceotides gave significant and reproducible
CC   inhibition of the level of Ki-ras mRNA. These oligonucleotides may be
CC   used for detecting and modulating, esp. inhibiting,expression of the Ki-
CC   ras gene, esp.for inhibiting proliferation of cancer cells, and other
CC   conditions associated with Ki-ras oncogene activation. Activated (mutant)
CC   Ki-ras can be detected from its differential affinity for particular
CC   oligos. (Updated on 25-MAR-2003 to correct PN field.)

PT   New peptide nucleic acid oligomers for ras oncogene modulation -
PT   including specific inhibition of the activated gene, for diagnosis and
PT   treatment esp. of tumours.
XX
PS   Claim 1; Page 133; 148pp; English.
XX
CC   The sequences given in AAQ79822-57 represent peptide nucleic acids (PNA)
CC   that bind to complementary ssDNA and RNA strands through their
CC   oligoribonucleotide ligands which are linked to a peptide backbone. These
CC   sequences are directed to the human H-ras and K-ras genes and they
CC   modulate the expression of the ras gene in cells or tissues and
CC   specifically modulate the expression of the activated ras in cells or
CC   tissues suspected of harbouring a mutated gene. These sequences are
CC   designed to hybridise with the mRNA from the H-ras and K-ras genes which
CC   interferes with the normal role of mRNA causing a loss of function in the
CC   cell. These sequences are used in the treatment of tumours. (Updated on
CC   25-MAR-2003 to correct PN field.)

PT   New oligo:nucleotide derivs. specific for S-adenosyl:methionine
PT   decarboxylase related nucleic acid - useful as anti:sense inhibitors of
PT   this enzyme, esp. for treatment of tumours but also as hybridisation
PT   probes for diagnosis.
XX
PS   Claim 11; Page 45; 81pp; English.
XX
CC   This sequence represents a phosphorothioate analogue of an antisense
CC   oligonucleotide which targets the 5' untranslated region of S-
CC   adenosylmethionine decarboxylase (SAMDC) around nucleotides at positions
CC   -80 to -61. Antisense oligonucleotide analogues (AAT86500-14) which
CC   target the SAMDC gene are used to diagnose conditions associated with
CC   expression of SAMDC by specifically hybridising to RNA or DNA derived
CC   from the SAMDC gene. These antisense molecules are useful for therapeutic
CC   modulation (especially inhibition) of SAMDC synthesis, particularly to
CC   treat tumours (e.g. leukaemia, prostatic carcinoma, colon or brain
CC   tumours, but especially bladder cancer), but also other hyper-
CC   proliferative diseases such as psoriasis. They cause tumour regression
CC   and prevent establishment/growth of (micro)metastases. Inhibition of
CC   SAMDC reduces the level of polyamines (spermine and spermidine in cells),
CC   resulting in cytostasis and possibly apoptosis

PT   New polymorphic nucleic acid sequences from the human glucose-6-phosphate
PT   dehydrogenase locus - and derived allele-specific probes and primers,
PT   useful in disease diagnosis, forensic analysis and paternity testing.
XX
PS   Claim 6; Page 28; 37pp; English.
XX
CC   This sequence represents one of the allelic variants containing a human
CC   glucose-6-phosphate dehydrogenase (G6PD) locus polymorphic site.
CC   Sequences shown in AAV37652 to AAV37661 represent the 10 polymorphisms at
CC   10 nucleic acid sequence tagged sites in the human G6PD locus. Sequences
CC   flanking each of these polymorphic sites (allelic variants M1 to M10 )
CC   are shown in Table 2 to 11 of the specification. The invention provides
CC   new nucleic acid segments of 10-100 bases having at least 10 contiguous
CC   bases that include a polymorphic site, within the 10 potential sequences
CC   of the G6PD locus or their complements. Allele-specific oligonucleotides
CC   that hybridise with the nucleic acid sequences which are allelic variants
CC   or their complements are useful as probes and primers for analysing
CC   nucleic acid to indicate polymorphisms in the specified regions.
CC   Polymorphisms may be linked to disease or they can be used in forensic
CC   analysis or paternity testing. Since the 10 sequences are within 50000
CC   base pairs of the human genome (on chromosome X), the probability of
CC   recombination is low and the entire haplotype should be inherited
CC   unchanged for at least several generations making it a good indicator of
CC   paternity

PT   Antisense oligonucleotides regulating Activating Protein 1 subunits -
PT   hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell
PT   cycle expression and hyperproliferative disease.
XX
PS   Example 7; Page 52; 120pp; English.
XX
CC   AAV69993 to AAV70008 represent antisense oligonucleotides which are
CC   specifically hybridisable with a region of a nucleic acid encoding mouse
CC   c-Jun protein. The antisense compound regulates the expression of the c-
CC   Jun protein. The present invention also describes antisense
CC   oligonucleotides which regulate the c-Fos protein. The antisense
CC   oligonucleotides are used for the diagnosis and treatment of diseases or
CC   disorders associated with Activating Protein 1 expression, of which c-Fos
CC   and c-Jun are subunits. The antisense oligonucleotides are used in
CC   compositions as c-Fos and/or c-Jun together with a carrier and a
CC   chemotherapeutic agent. They are used to regulate the expression of c-Fos
CC   or c-Jun in cells or tissues, preferably by inhibiting metastasis. They
CC   also regulate cell cycle expression and can be used to treat an animal
CC   with, or being prone to, a hyperproliferative disease

PT   New method for cloning specific genes - useful for altering genetic
PT   characteristics of cells.
XX
PS   Example 1; Page 6; 13pp; Japanese.
XX
CC   This sequence represents a PCR primer for HIV-1 sequences, that was used
CC   to test the method of the invention. The method is for cloning of a
CC   specific gene, and comprises: (1) treating a sample cDNA with the
CC   restriction enzyme RsaI; (2) binding the treated cDNA to a linker X; (3)
CC   treatment with the restriction enzyme BsmFI; (4) binding to a linker Y,
CC   different from X, to give a cDNA minor fragment library composed of 5'-
CC   linker X-[having 16 bases at RsaI cleaved site (AC) at 5'-side]-linker Y-
CC   3' and (5) cloning of consecutive 14 bases at the RsaI cleaved site (AC)
CC   specific to the sample cDNA. The method is used to clone specific genes
CC   which may then be used to alter the characteristics of cells

PT   New oligonucleotides for inhibiting ras gene in mutant and activated form
PT   - also used to detect ras genes.
XX
PS   Disclosure; Page 38; 118pp; English.
XX
CC   AAV84024-37 represent antisense phosphorothioate oligonucleotides
CC   directed against human Ki-ras. The oligonucleotides are representative of
CC   the invention, where each oligonucleotide has at least one portion
CC   comprising at least one CH2-NH-O-CH2, CH2-O-N(CH3)-CH2, CH2-N(CH3)-N(CH3)
CC   -CH2 or O-N(CH3)-CH2-CH2 linkage alternating with a phosphorothioate or
CC   phosphodiester linkage. The oligonucleotides are used for the inhibition
CC   of expression of the ras gene in both the normal and the activated form,
CC   the latter of which has been implicated in tumour formation. They are
CC   also used for the detection of the ras gene in cells and tissues and the
CC   treatment of conditions arising from the activation of the ras gene i.e.
CC   to inhibit the proliferation of cancer cells

PT   New oligonucleotide targetting human N-ras nucleic acid - is capable of
PT   inhibiting human N-ras expression, useful for preventing or treating
PT   conditions arising from the activation of a human N-ras oncogene.
XX
PS   Disclosure; Page 35; 97pp; English.
XX
CC   The invention relates to oligonucleotides, which target a nucleic acid
CC   encoding human N-ras, and are capable of inhibiting human N-ras
CC   expression. The antisense oligonucleotides form a pharmaceutical
CC   composition, which is useful for modulating the expression of human N-
CC   ras, inhibiting the proliferation of cancer cells, and preventing or
CC   treating conditions arising from the activation of a human N-ras
CC   oncogene. The oligonucleotides are also useful in diagnostics,
CC   therapeutics, and as research reagents and kits. The oligonucleotides
CC   enable the specific modulation of activated human N-ras expression, which
CC   is associated with tumour formation. Sequences AAX21620-633 represent
CC   antisense oligonucleotides complementary to human Ki-ras

PT   Liposome-encapsulated oligonucleotides useful for treating or preventing
PT   cancers associated with ras gene activation.
XX
PS   Example 1; Page 111; 120pp; English.
XX
CC   This invention describes novel compositions comprising oligonucleotides
CC   (AAX56957-X57017), entrapped within liposomes, that hybridize
CC   specifically to a target DNA or mRNA which encodes a mutant or wild-type
CC   ras protein. The products of the invention have anticancer activity and
CC   specifically bring about the antisense inhibition of ras genes or mRNA.
CC   The products of the invention are used to modulate expression of a ras
CC   gene in cells, tissue, organs or organisms, particularly to inhibit cell
CC   growth and especially to treat or prevent cancers associated with
CC   activation of a ras gene. Encapsulating the oligonucleotide reduces the
CC   rate at which it is cleared from the blood when compared with non-
CC   encapsulated material, and the oligonucleotides become distributed to
CC   practically all parts of the body

PT   New antisense oligonucleotides - for modulation of human B-raf gene
PT   expression.
XX
PS   Claim 7; Page 22; 72pp; English.
XX
CC   This sequence represents an example of an antisense oligonucleotide of
CC   the invention. The oligonucleotides are 8-50 nucleotides in length, and
CC   are targeted to a nucleic acid encoding human B-raf and which is capable
CC   of inhibiting human B-raf expression. The oligonucleotides is used to
CC   inhibit the (abnormal) expression of human B-raf, to inhibit
CC   hyperproliferation of cells, to treat or prevent an abnormal
CC   proliferative condition, e.g. hyperproliferative disorders such as cancer
CC   (e.g. of the brain or nervous system), restenosis, psoriasis or a
CC   disorder characterised by T-cell activation and growth. They may also be
CC   used to diagnose these diseases, as well as atherosclerosis. The
CC   oligonucleotides of the invention may be used to distinguish raf-
CC   associated tumours from tumours having other etiologies. The antisense
CC   oligonucleotides can also be used to quantify raf expression in assays

XX
CC   AAX91991-X97517 represent PCR primers used to amplify open reading frames
CC   and other nucleic acid sequences from the genome of Chlamydia pneumoniae
CC   (see AAX91990). C. pneumoniae causes respiratory disease such as
CC   pneumonia and bronchitis and is thought to be a contributing factor in
CC   heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema
CC   nodosum or pharyngitis. The polypeptides encoded by the open reading
CC   frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
CC   in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
CC   nucleotides sequences can also be used as immunogenic compositions,
CC   especially where the vector directs the expression of a neutralising
CC   epitope of C. pneumoniae

PT   Genome sequence of Chlamydia pneumoniae.
XX
PS   Page 1768; Disclosure; 1912pp; English.
XX
CC   AAX91991-X97517 represent PCR primers used to amplify open reading frames
CC   and other nucleic acid sequences from the genome of Chlamydia pneumoniae
CC   (see AAX91990). C. pneumoniae causes respiratory disease such as
CC   pneumonia and bronchitis and is thought to be a contributing factor in
CC   heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema
CC   nodosum or pharyngitis. The polypeptides encoded by the open reading
CC   frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
CC   in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
CC   nucleotides sequences can also be used as immunogenic compositions,
CC   especially where the vector directs the expression of a neutralising
CC   epitope of C. pneumoniae

PT   New antisense oligonucleotides that detect and modulate the expression of
PT   Jun N-terminal kinase proteins - useful for treating hyperproliferative
PT   diseases and inhibiting tumor growth in animals, and for modulating
PT   protein phosphorylation by these proteins.
XX
PS   Example 3; Page 66; 190pp; English.
XX
CC   The invention relates to antisense oligonucleotides that detect and
CC   modulate the expression of Jun N-terminal kinase (JNK) proteins. The
CC   oligonucleotides specifically hybridize to a nucleic acid encoding a
CC   JNK1, JNK2 or JNK3 protein, and which modulate expression of these
CC   proteins. The oligonucleotides are useful for modulating JNK protein
CC   expression and cell cycle progression in cultured cells or animal cells.
CC   The oligonucleotides are also useful for modulating the phosphorylation
CC   of a protein that has been phosphorylated by a JNK protein, and the
CC   expression of a cellular protein that promotes one or more metastatic
CC   events. The oligonucleotides also form pharmaceutical compositions for
CC   treating animals with a hyperproliferative disease, and for inhibiting
CC   tumor growth in an animal

PT   High specific activity recombined human interferon alpha m and its
PT   preparation process.
XX
PS   Claim 2; Page 1; 7pp; Chinese.
XX
CC   On the basis of research on interferon (IFN) alpha Ic and the experiment
CC   of IFN alpha 1c/86D, the present invention applies the peptide pool
CC   constructed by using bacteriophage display technology to the research of
CC   alpha interferon receptor binding zone to develop a new-type mutant IFN
CC   alpha m, based on IFN alpha 1c/86D. Its specific activity can be up to
CC   1.1X10 to the power 8 IU/mg. The invented IFN alpha m possesses high
CC   specific activity to reduce the toxic side effects due to long-period
CC   application of interferon therapy, and can be used as a candidate
CC   production strain for producing a second generation interferon product.
CC   The present sequence represents a PCR primer used in the preparation of
CC   the novel human IFN alpha m

PT   Nucleic acids encoding interphotoreceptor matrix proteoglycans useful for
PT   preventing, diagnosing and treating ocular disorders such as retinal
PT   detachment and chorioretinal degeneration.
XX
PS   Claim 43; Page 44; 183pp; English.
XX
CC   PCR primers AAA46209-42 were used to amplify cDNA encoding an
CC   interphotoreceptor matrix (IPM) proteoglycan, designated IPM150. The
CC   protein is an IPM component (IPMC). Two subfamilies of IPMCs, IPM150 and
CC   IPM200, exist. The human IPM150 gene is located on chromosome 6q13-q15,
CC   between markers CHLC.GATA11F10 and D6S284. The IPM proteins may be used
CC   to supplement a patients own production of the protein or to rectify
CC   alterations in their nucleic acids that result in expression of an
CC   inactive protein. The IPM nucleic acids may be used in this way to treat
CC   ocular diseases such as retinal detachment, chorioretinal degeneration,
CC   retinal degeneration, age related macular degeneration, photoreceptor
CC   degeneration, RPE (retinal pigment epithelium) degeneration, cone
CC   degeneration, mucopolysaccharidosis, rod-cone dystrophy and cone-rod
CC   dystrophy. The nucleic acids and proteins may also be used to assay for
CC   other modulators of IPM proteoglycan expression and activity that may be
CC   used to treat ocular diseases. The nucleic acids and proteins may also be
CC   used as diagnostic reagents to detect the presence of IPM nucleic acids
CC   and their products in samples from patients according to standard
CC   methodologies

PT   Oligonucleotides targeted to human H-ras or human Ki-ras coding
PT   sequences, useful for treating and preventing cancer.
XX
PS   Claim 9; Col 19; 41pp; English.
XX
CC   The present sequence was used in methods for the modulation of ras
CC   expression. Antisense oligonucleotides were designed to specifically
CC   target mRNA encoding human H-ras, Ki-ras and N-ras. The oligonucleotides
CC   can be used to inhibit the proliferation of cancer cells and to prevent
CC   or treat a condition arising from the activation of a ras oncogene. They
CC   may also be used to modulate the expression of human H-ras or human Ki-
CC   ras. The antisense oligonucleotides may contain modified backbones,
CC   substituted sugar moieties and modified bases. The sequences preferably
CC   have a phosphorothioate backbone. They are preferably
CC   oligodeoxynucleotides or chimeric oligonucleotides containing 2'-O-methyl
CC   ends and a central deoxy gap

PT   Novel antisense oligonucleotides for modulating the expression of human
PT   SHP-1, especially for treating a disease or condition associated with SHP
PT   -1 expression, e.g. cancer.
XX
PS   Claim 3; Col 41; 33pp; English.
XX
CC   The invention relates to antisense oligonucleotides which modulate the
CC   expression of human SHP-1 (Src homology region 2-domain phosphatase) a
CC   cytosolic tyrosine phosphatase. The invention includes antisense
CC   molecules AAA09644-A09683 which have modified phosphorothioate
CC   internucleoside linkages which target various regions of the SHP-1 gene.
CC   The oligonucleotides inhibit the expression of human SHP-1 in cells or
CC   tissues, and may be used to treat diseases or conditions associated with
CC   SHP-1 expression e.g. cancers, specifically leukaemia

PT   New antisense oligonucleotides targeting nucleic acids encoding human
PT   MDMX useful for inhibiting MDMX expression and for treating diseases
PT   associated with MDMX expression e.g. tumor formation, inflammation.
XX
PS   Claim 3; Col 79-80; 51pp; English.
XX
CC   This invention describes a novel antisense compound (I), 8-30 nucleobases
CC   in length, targeted to a nucleic acid encoding a human MDMX. (I)
CC   specifically hybridizes with and inhibits the expression of human MDMX.
CC   The products of the invention have anticarcinogen, antiinflammatory and
CC   antiinfectious activity. Synthesized chimeric oligonucleotides targeted
CC   to human MDMX, 20 nucleotides in length, composed of a central gap region
CC   consisting of ten 2'-deoxynucleotides flanked on both sides by 5-
CC   nucleotide wings were tested for antisense inhibition of MDMX expression.
CC   Results of real-time quantitative polymerase chain reaction (PCR) showed
CC   71 out of the 159, 20 base pair sequences, all fully defined in the
CC   specification, demonstrated at least 30% inhibition of MDMX expression.
CC   The antisense oligonucleotides are useful for effective and specific
CC   modulation, particularly inhibition of MDMX expression, and may be used
CC   in treating humans or animals suspected of having or being prone to a
CC   disease or condition associated with expression of MDMX. The antisense
CC   oligonucleotides may also be used as research reagents or kits, and as
CC   diagnostics, e.g. to elucidate the function of a particular gene or to
CC   distinguish between functions of various members of a biological pathway,
CC   and as prophylaxis, e.g. to prevent or delay infection, inflammation or
CC   tumor formation. AAA11781-A11945 represent antisense oligonucleotides
CC   described in the method of the invention

PS Claim 3; Col 41; 38pp; English.
XX
CC The present sequence is one of a large number of antisense
CC oligonucleotides which are targeted to nucleic acids encoding fra-1. The
CC sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides
CC containing a central gap region consisting of ten 2'-deoxynucleotides,
CC which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The
CC oligonucleotides have a phosphorothioate backbone and the cytidine
CC residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 antisense
CC oligonucleotides are useful for inhibiting the expression of fra-1 in
CC human cells or tissues. They can be used for diagnostics, therapeutics,
CC prophylaxis and as research reagents and in kits. Use of the antisense
CC compounds may also be useful prophylactically, e.g. to prevent or delay
CC infection, inflammation or tumour formation

PT Novel methods for reducing apoptosis comprising contacting cells with
PT antisense oligonucleotides, useful for treating apoptotic disorders, e.g.
PT cancer.
XX
PS Example 3; Page 131; 160pp; English.
XX
CC The present invention relates to antisense oligonucleotides (AAC62844-
CC C63000, AAA96093-A96099 and AAA07993) that hybridise specifically to a
CC nucleotide encoding a Jun N-terminal kinase (JNK2) protein, resulting in
CC decrease of JNK2 expression and leading to induction of apoptosis. The
CC present sequence is one such antisense oligonucleotide. The
CC oligonucleotides of the present invention are useful for treating
CC diseases or conditions with reduced apoptosis, e.g. cancer and cellular
CC hyperproliferation. The oligonucleotides may also be used to increase the
CC stimulation of apoptotic proteins, e.g. for treating Alzheimer's or
CC Parkinson's disease, amylotrophic lateral sclerosis, retinitis,
CC pigmentosa, epilepsy, myocardial infarction, stroke, obstructive
CC jaundice, polycystic kidney and diabetes. The present sequence may have a
CC phosphorothioate backbone

XX
CC   This invention relates to a full length provirus genomic DNA sequence
CC   AAC66281 of equine infectious anemia virus (EIAV) from the donkey
CC   leukocyte strain. Included in the invention are the gag, pol, env, rev,
CC   tat, and S2 gene sequences AAC66314 - AAC66319 and their encoded proteins
CC   AAB35754 - AAB35759. The invention also relates to PCR primers AAC66282 -
CC   AAC66288 which are used to isolate the EIAV DNA sequences. Other primers
CC   represented in AAC66289 - AAC66313 are also used in the course of the
CC   invention for the isolation and characterisation of the DNA sequences
CC   identified in the invention. The genes and proteins can be used for
CC   preparing gene mutation and deletion vaccines, DNA vaccines and
CC   diagnostics and in producing an equine infectious anemia virus gene
CC   transfer system for gene therapy. The proteins and polynucleotides may
CC   also be used in the study of HIV

PT   Predicting susceptibility to HIV infection or progression useful for
PT   selection of therapeutic treatment for persons infected with HIV virus,
PT   comprises detecting polymorphism in human interleukin-10 promoter.
XX
PS   Example 1; Page 11; 40pp; English.
XX
CC   The present invention describes a method for predicting susceptibility to
CC   HIV infection or HIV progression in a subject. The method involves
CC   detecting a polymorphism in a human interleukin-10 (IL-10) promoter,
CC   where the presence of the polymorphism indicates susceptibility to HIV
CC   infection or HIV progression. The method provides prognostic information
CC   to persons infected with HIV virus and is useful to help select
CC   treatments (such as administration of IL-10 or gene therapy with IL-10).
CC   The presence of polymorphism is useful as predictor that very aggressive
CC   treatment could substantially eradicate the virus from the infected
CC   person. The method is useful for the generation of normograms or other
CC   predictive algorithms that can be used, in association with allele
CC   status, to prognose probable survival or years to development of AIDS
CC   following HIV seroconversion. It indicates that increased expression of
CC   the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression
CC   and enables a variety of new therapeutic interventions in the treatment
CC   of HIV disease. The present sequence represents a short tandem repeat
CC   (STR) primer which is used in an example from the present invention

PT   New isolated phosphoenolpyruvate carboxylase kinase (PEPc kinase) enzyme
PT   useful for production of transgenic plants such as Brassicaceae, Musaceae
PT   and Solanaceae.
XX
PS   Disclosure; Page 29; 76pp; English.
XX
CC   The sequence represents a PCR primer used in expression studies of
CC   phosphoenolpyruvate carboxylate (PEPc) kinase enzyme. PEPc kinase
CC   regulates PEPc activity in C_3 and C_4 plants and in plants that exhibit
CC   Crassulacean acid metabolism (CAM), by reversible phosphorylation.
CC   Antibodies can be raised to plant PEPc kinase for detecting the presence
CC   of the enzyme in a sample. PEPc kinase DNA is useful for the production
CC   of transgenic plants, such as CAM plants, C_3 plants or C_4 plants, from
CC   the family Brassicaceae, Musaceae, Solanaceae, Poaceae or Malvaceae. The
CC   DNA may also be used in the production of eukaryotic cells, particularly
CC   plant cells having a modified PEPc kinase activity, as a probe to amplify
CC   and/or analyse PEPc kinase coding sequence from a chosen organism and in
CC   diagnostic assays to determine the presence of a PEPc kinase coding
CC   sequence in an organism. PEPc kinase can be used to supply and manipulate
CC   PEPc kinase enzymatic activity in vitro in order to alter levels of
CC   sugar, storage, carbohydrate, lipid and/or protein content of leaves,
CC   fruits, seeds, tubers and other organs in a wider range of species as a
CC   result of altered partitioning of carbon/nitrogen

PT   Antisense compound 8 to 30 nucleobases in length comprising a compound
PT   that is targeted to a nucleic acid molecule encoding glycogen synthase
PT   kinase 3 alpha, useful for the treatment of e.g. diabetes and
PT   hyperproliferative disorders.
XX
PS   Example 15; Page 83; 115pp; English.
XX
CC   The invention relates to an antisense compound 8 to 30 nucleobases in
CC   length targetted to a nucleic acid encoding glycogen synthase kinase 3
CC   alpha. The antisense compound specifically hybridises with and inhibits
CC   the expression of glycogen synthase kinase 3 alpha. The antisense
CC   compound is useful for the treatment of a diseases associated with
CC   glycogen synthase kinase 3 alpha such as diabetes, a neurological
CC   disorder, a haematopoietic disorder, a hyperproliferative disorder or a
CC   developmental disorder. The antisense compounds may also be used
CC   prophylactically to prevent or delay infection, inflammation or tumour
CC   formation. The present sequence is a phosphorothioate antisense
CC   oligonucleotide targetted to human glycogen synthase kinase 3 alpha
CC   genomic DNA

PT   Antisense compound useful for treating hyperproliferative, neurological,
PT   inflammatory and autoimmune disorders and diabetes inhibits human PARP.
XX
PS   Example 17; Page 88; 168pp; English.
XX
CC   The invention relates to antisense oligonucleotides targeted to human
CC   PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly
CC   (ADP-ribose) polymerase plays an important role in chromatin
CC   decondensation, DNA replication, DNA repair, gene expression, malignant
CC   transformation, cellular differentiation and apoptosis. The antisense
CC   oligonucleotide inhibitors are useful for inhibiting the expression of
CC   PARP in human cells or tissues. They are also useful for treating a human
CC   with a disease associated with PARP especially hyperproliferative
CC   disorders (e.g. cancer), cellular injury resulting from oxidative stress,
CC   neurological (e.g parkinsonism, meningitis-associated intracranial
CC   complications and ischaemia) , inflammatory and autoimmune disorders (e.g
CC   arthritis) and diabetes. The present sequence is an antisense
CC   oligonucleotide of the invention

PT   Nucleic acid sequences are used to generate universal probes and primers
PT   which can be used to identify and detect the presence of algal, archaeal,
PT   bacterial, fungal and parasitical species in a test sample.
XX
PS   Claim 11; Page 756; 1580pp; English.
XX
CC   The present invention describes a method for generating a repertory of
CC   nucleic acids of tuf, fus, atpD and/or recA genes from which probes
CC   and/or primers are derived. The method comprises amplifying the nucleic
CC   acids of determined algal, archaeal, bacterial, fungal and parasitical
CC   species with a combination of defined primer pairs. The method can be
CC   used for producing probes and/or primers for detecting one or more
CC   related microorganisms e.g. algae, archaea, bacteria, fungi and
CC   parasites, for universal detection and for specific and ubiquitous
CC   detection and identification of an algal, archaeal, bacterial, fungal and
CC   parasitical species, genus, family and group. A nucleic acid (I) obtained
CC   using the method of the invention can be used for the universal detection
CC   of any bacterium, fungus or parasite in a sample and for the detection of
CC   at least one antimicrobial agent resistance gene or at least one toxin
CC   gene. hexA nucleic acids are used for the specific and ubiquitous
CC   detection and for identification of Streptococcus pneumoniae. (I) can be
CC   used to design a therapeutic agent which is effective against
CC   microorganisms. Microbial species or genus or family or phylum or group
CC   which can be detected include Abiotrophia adiacens, Bordetella sp.,
CC   Corynebacterium sp., Enterobacteriaceae group, Escherichia coli,
CC   Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria
CC   gonorrhoeae and Staphylococcus sp. . Using DNA based tests provides faster
CC   results than substrate specificity tests as results can be determined in
CC   an hour and improved accuracy is also achieved. AAH00010 to AAH002304
CC   represent nucleotide sequences and primers/probes which are given in the
CC   exemplification of the present invention

PT Antisense compound capable of modulating the expression of phosphoenol
PT pyruvate carboxykinase-cytosolic, useful for preventing or delaying
PT infection, inflammation or tumor formation.
XX
PS Claim 1; Col 43; 64pp; English.
XX
CC The present sequence is one of a number of antisense compounds of up to
CC 30 nucleobases in length that are capable of inhibiting the expression of
CC phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The
CC antisense compounds are useful for inhibiting the expression of PEPCK-
CC cytosolic in cells or tissues. They are commonly used as research
CC reagents and in diagnostics, e.g. to elucidate the function of particular
CC genes. They are also useful for distinguishing between functions of
CC various members of a biological pathway and for research use. The
CC antisense compounds are also useful prophylactically, e.g. to prevent or
CC delay infection, inflammation or tumour formation. The present sequence
CC is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a
CC deoxy gap

PT New human death-associated protein 6 (DAXX) gene variants comprising 19
PT polymorphic sites useful in studying the effect of variation on the
PT biological activity of DAXX and in developing drugs targeting the
PT protein.
XX
PS Example 1; Page 30; 97pp; English.
XX
CC Sequences AAS04452-AAS04485 represent PCR primers used to amplify regions
CC of a DNA encoding human death-associated protein 6 (DAXX). This DNA may
CC comprise one or more polymorphisms at specific nucleotide positions to
CC form one of nineteen possible polymorphic variants. Associations between
CC a trait and a genotype or a haplotype of the DAXX gene can be identified
CC by comparing the frequency of the genotype or haplotype in a population
CC exhibiting the trait with that of a reference population. A higher
CC frequency in the trait population indicates an association. Methods
CC involving genotyping or haplotyping of the DAXX gene of an individual can
CC lead to prediction of haplotype pairs for the DAXX gene of related
CC individuals, and may be useful in studying the expression and biological
CC function of DAXX, as well as in developing drugs targeting this protein.
CC Polymorphic variants of DAXX are useful in studying the effect of the
CC variation on the biological activity of DAXX as well as on the binding
CC affinity of candidate drugs targeting DAXX for the treatment of
CC autoimmune diseases and other immune disorders. Polymorphism is also
CC useful for studying population diversity, anthropological lineage,
CC paternity testing, forensic applications, and for identifying
CC associations between the DAXX genetic variation and a trait such as level
CC of drug response or susceptibility to disease. DAXX proteins may be used
CC to measure binding affinities of one or more candidate drugs targeting
CC the DAXX protein

XX
PT New nucleic acid molecular structure, useful for detection of common RHD
PT positive haplotypes in D-negative individuals, comprises RHD, SMP1 and
PT RHCE genes.
XX
PS Example 12; Page 66; 135pp; English.
XX
CC The sequence represents PCR primer re012, used to detect RHD positive
CC haplotypes in RHD negative individuals. The primer was used in DNA typing
CC using PCR-sequence length polymorphism (SSP) of the Rhesus genes locus
CC comprising the RHD, SMP1 and RHCE (all undefined) genes and/or the Rhesus
CC box(es), preferably the hybrid Rhesus box, the upstream Rhesus box and/or
CC the downstream Rhesus box. The RHD and RHCE genes are located at
CC chromosome 1 p34.1-p36. Rhesus box flanks the breakpoint region of the
CC RHD deletion in the common RHD negative haplotypes. The primers of the
CC invention are useful for: (1) the specific detection of the common RHD
CC positive haplotypes in D-negative individuals; (2) blood group typing;
CC (3) determining whether a patient can be transfused with RhD negative
CC blood and whether blood is suitable for transfusion to patients who
CC should not be exposed to antigen C; (4) assessing the risk of a RhD
CC negative mother of conceiving or carrying an RhD positive foetus. Anti-D
CC antibodies are useful for treating pregnant women who are Rhesus D
CC negative, where the foetus is not homozygous for the RHD gene to treat or
CC prevent haemolytic disease of the newborn

PT New antisense compound targeting nucleic acid encoding human mitogen-
PT activated protein kinase kinase 1 (MEKK1), useful for treating diseases
PT or conditions associated with MEKK1 expression, or preventing
PT inflammation or tumor formation.
XX
PS Claim 14; Col 40; 35pp; English.
XX
CC Sequences AAF27086-AAF27125 represent phosphorothioate antisense
CC oligonucleotides targetted to the human MEKK1 gene, which inhibit its
CC expression. The antisense oligonucleotides were designed to target
CC different regions of the human MEKK1 RNA, and were analysed for their
CC effect on MEKK1 mRNA levels by quantitative real-time PCR. MEKK1 (also
CC known as mitogen-activated protein kinase kinase kinase 1, MEK kinase 1
CC and MAP/ERK kinase kinase 1) is a dual-specific serine/threonine kinase
CC which mediates cellular responses to mitogenic stimuli, being involved in
CC JNK/SAPK (Jun N-terminal kinase/stress- activated protein kinase) MAP
CC kinase cascades. MEKK1 regulates signalling events associated with
CC apoptosis (programmed cell death) and NF-kappa-B, both of which have been
CC associated with the development of hyperproliferative disorders such as
CC cancer. Specifically, MEKK1 lies directly downstream of Bcl-2 in an
CC apoptotic signalling cascade, and plays a critical role in the control of
CC NF-kappa-B-mediated transcription at multiple points in the apoptotic
CC cascade. The oligonucleotides of the invention are useful for diagnosis,
CC prevention and treatment of conditions associated with MEKK1 expression,
CC such as inflammation, and cancer and other hyperproliferative disorders

PT   Predicting the potential of an oligonucleotide to hybridize to a target
PT   nucleotide sequence, useful for evaluating oligonucleotide probe
PT   sequences, by identifying a oligonucleotides based on the evaluation of
PT   parameters.
XX
PS   Example 2; Col 65; 342pp; English.
XX
CC   The present invention describes a method for predicting the potential of
CC   an oligonucleotide to hybridise to a (complementary) target nucleotide
CC   sequence, involving identifying a subset of oligonucleotides within the
CC   predetermined number of unique oligonucleotides based on the evaluation
CC   of the parameter. Oligonucleotides in the subset are identified that are
CC   clustered along a region of the nucleotide sequence that is hybridisable
CC   to the target nucleotide sequence. This is useful for evaluating
CC   oligonucleotide probe sequences. The present sequence is an
CC   oligonucleotide described in the exemplification of the invention.

PT   Novel isolated polynucleotide comprising a sequence which is a
PT   polymorphic variant for a reference sequence for interleukin 3 gene
PT   useful for studying the expression and biological function of the
PT   protein.
XX
PS   Example 1; Page 27; 62pp; English.
XX
CC   The invention describes an isolated polynucleotide (I) comprising a
CC   sequence which is a polymorphic variant for a reference sequence for
CC   interleukin 3 (colony-stimulating factor) (IL3) gene or its fragment. (I)
CC   Is useful for studying the expression and biological function of IL3, as
CC   well as in developing drugs targeting the IL3 protein. A transgenic
CC   animal is useful for studying expression of IL3 isogenes in vivo, for in
CC   vivo screening and testing of drugs targeted against IL3 protein, and for
CC   testing the efficacy of therapeutic agents and compounds for diseases of
CC   the central nervous system e.g. multiple sclerosis, Alzheimer's disease,
CC   Parkinson's disease and CNS injury, and immune or inflammatory disorders.
CC   The method described in the invention is useful in developing diagnostic
CC   tests and therapeutic treatments for diseases of the central nervous
CC   system and immune or inflammatory disorders. This sequence represents a
CC   sequencing primer used to sequence regions of the IL-3 gene in order to
CC   study polymorphisms in the gene

PT   Diagnosing pancreatic adenocarcinoma, particularly for the early
PT   detection of the pancreatic cancer, comprises employing primers or
PT   antibodies that are specific for the MUC4-encoding nucleic acid or MUC4
PT   protein, respectively.
XX
PS   Example 1; Page 29; 63pp; English.
XX
CC   PCR primers ABQ78575-76 were used to amplify human mucin 5B (MUC5B) cDNA.
CC   Peripheral blood monocytes (PBMCs) isolated from pancreatic cancer
CC   patients are positive for MUC4, while MUC4 expression is not observed in
CC   PBMCs isolated from normal patients or from patients suffering from
CC   chronic pancreatitis or other types of cancers. Expression of MUC4 can
CC   therefore be used as an indication of pancreatic cancer. The
CC   specification describes a method for detecting a MUC4-encoding nucleic
CC   acid or a MUC4 protein in a biological sample as a tumour marker for
CC   pancreatic cancer. The method comprises contacting a nucleic acid
CC   extracted from the sample with oligonucleotide primers that specifically
CC   hybridise to the MUC4 nucleic acid; or contacting a biological sample
CC   with an antibody (or its fragment) that has specific binding affinity for
CC   MUC4. The method is useful for diagnosing pancreatic cancer or pancreatic
CC   adenocarcinoma, particularly for early detection of pancreatic cancer

PT   Antisense compounds targeted to nucleic acids encoding RECQL2 associated
PT   with Bloom's disorder, for modulating RECQL2 expression and treating
PT   diseases e.g. tumors associated with expression of the RECQL2 in humans.
XX
PS   Claim 3; Col 45; 86pp; English.
XX
CC   The invention relates to antisense compounds targetted to nucleic acid
CC   encoding RECQL2 (gene associated with Bloom's disorder) to inhibit the
CC   expression of RECQL2. Antisense compounds of the invention are useful for
CC   treating diseases associated with expression of RECQL2, in humans. They
CC   are useful for diagnostics, therapeutics and as research reagent, e.g.
CC   prophylactically to prevent or delay infection, inflammation or tumour
CC   formation. They are also useful in antisense therapy. The present
CC   sequence is an antisense oligonucleotide targetted to human RECQL2 DNA

PT   Separation of a mixture of single-stranded polynucleotides e.g. DNA, or
PT   RNA, comprises applying the mixture to a polymeric separation medium
PT   having non-polar surfaces, and then separating the mixture.
XX
PS   Example 16; Page 43; 91pp; English.
XX
CC   The invention comprises a method of separating a mixture which contains
CC   single-stranded polynucleotides. The method of the invention involves
CC   applying the mixture to a polymeric separation medium having non-polar
CC   surfaces. The non-polar surfaces are free from multivalent cations
CC   (preferably chromium, iron, nickel and/or copper) and are free to bind or
CC   interfere with the polynucleotides. The method of the invention is useful
CC   for separating a mixture that contains single-stranded polynucleotides
CC   (e.g. DNA and RNA) having lengths from 5 - 200 up to 2000 - 20000
CC   nucleotides from impurities (e.g. failure sequences, salts and/or
CC   proteins). The method of the invention allows separation to be achieved
CC   within 10 - 30 minutes, in contrast to conventional gel chromatography
CC   which can require hours or days. The present DNA sequence represents an
CC   oligonucleotide that was used in an example of the invention

PT   New variants of calcium/calmodulin-dependent protein kinase-like nucleic
PT   acids and polypeptides, useful for diagnosing and treating
PT   neuropsychiatric disorders, e.g. schizophrenia, schizoaffective disorder,
PT   and bipolar disorder.
XX
```

PS Claim 17; Page 98; 223pp; English.
XX
CC The invention relates to a nucleic acid comprising a polymorphic region
CC of a Calcium/Calmodulin-dependent protein kinase-like gene (CADPKL)
CC allelic variant, and the polypeptide it encodes. CADPKL allelic variants
CC are useful in determining whether a subject has or is at risk of
CC developing a neuropsychiatric disorder, such as schizophrenia, attention
CC deficit disorder (ADD), schizoaffective disorder, bipolar disorder,
CC unipolar affective disorder and adolescent conduct disorder. The
CC polypeptides, polynucleotides, antibodies and modulators of the CADPKL
CC allelic variants are useful for diagnosing or treating these
CC neuropsychiatric disorders. The polypeptides may be used to raise
CC antibodies to a CADPKL polypeptide. The nucleic acids may be used as
CC probes or primers, in pharmacogenomics for designing therapies for the
CC disorders, and in fingerprinting for detection of different individuals
CC with the same species (e.g. paternity testing). This sequence represents
CC a PCR primer used to amplify human CADPKL DNA of the invention

PT Arraying genome clones.
XX
PS Claim 6; Page 57; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are
CC specifically claimed for use in the present invention

PT   Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting
PT   amplification products to 2-dimensional gel electrophoresis to produce a
PT   characteristic spot pattern for a specific mutation in either the BRCA1
PT   or the hMLH1 gene.
XX
PS   Claim 1; Page 40; 57pp; English.
XX
CC   The invention relates to detecting mutations in the BRCA1 and hMLH1 gene
CC   comprising subjecting a set of amplification products to two-dimensional
CC   DNA electrophoresis (TGDS) to produce a characteristic spot pattern for a
CC   specific mutation in either the BRCA1 or the hMLH1 gene. Also included
CC   are test kits for enabling BRCA1 or hMLH1 gene testing comprising short
CC   PCR primers given in the specification, mixed in 20 mM of Tris-HCl, 50 mM
CC   KCl, 25 micro M of dNTP, and 5 % formamide. The method is useful for
CC   detecting mutations in the BRCA1 (breast and ovarian cancer
CC   susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA
CC   mismatch repair gene). The present sequence is a PCR primer specific to
CC   BRCA1 used in the method of the invention

CC The invention relates to an isolated variant of a mammal genomic sequence
CC of the gene coding for the translation initiation factor 2 alpha kinase 3
CC (EIF2AK3). The EIF2AK3 nucleic acid variant is useful for the production
CC of a recombinant or synthetic polypeptide, and for screening compounds
CC capable of modulating EIF2AK3. The nucleic acid is also useful for
CC screening or diagnosing the diseases cited below. The nucleic acid of may
CC be used as sense or anti-sense oligonucleotide. The nucleic acid may also
CC be used as a primer or a probe, for detecting and/or amplifying a nucleic
CC acid sequence. The compound is useful as a medicament, particularly for
CC preventing and/or treating diabetes and/or pathology related to WRS, e.g.
CC type 1 diabetes, type 2 diabetes, the others forms of diabetes,
CC osteoporosis, arthritis, hepatic dysfunction, nephropathies or other
CC renal dysfunction, or mental retardation. The cell the mammal or the
CC polypeptide is useful for studying the expression or the activity of the
CC EIF2AK3 protein, and the direct or indirect interactions between the
CC EIF2AK3 protein and chemical or biochemical compounds, which may be
CC involved in the activity of the EIF2AK3 protein. The cell or polypeptide
CC is also useful for screening chemical or biochemical compounds capable of
CC interacting directly or indirectly with the EIF2AK3 protein, and/or
CC capable of modulating the expression or the activity of the EIF2AK3
CC protein. ABK24521-ABK24624 represent human EIF2AK3 coding sequences and
CC PCR primers of the invention

PT New glucose transporter gene and protein, designated GLUT10, useful for
PT studying and analyzing biological processes of glucose metabolism and
PT Type 2 diabetes, as well as for screening modulators of glucose
PT transporter activity.
XX
PS Example 4; Page 52; 85pp; English.
XX
CC The invention relates to a novel glucose transporter gene and protein,
CC designated GLUT10. GLUT 10 is an insulin-responsive glucose transporter
CC gene located in the type 2 diabetes linked region of chromosome 20Q12-
CC 13.3. The GLUT 10 polypeptide can be expressed by standard recombinant
CC methodology. The GLUt 10 glucose transporter gene and protein are useful
CC for studying and analysing biological processes of both glucose
CC metabolism and type 2 diabetes. These are also useful in drug screening
CC techniques, especially for screening modulators of glucose transporter
CC activity or compounds having the ability to be transported across the
CC cell membranes. Sequences ABL58290-315 represent primers specific for the
CC various regions of the human GLUT 10 glucose transporter gene, used in
CC single strand conformational polymorphism (SSCP) analysis of the gene

XX
PS Claim 36; SEQ ID NO 4719; 167pp + Sequence Listing; English.
XX
CC The invention relates to constructing (M1) a strain of diploid fungal
CC cells in which both alleles of a gene are modified, comprising modifying
CC one allele by insertion or replacement by a cassette having an
CC expressible selectable marker and modifying other allele by
CC recombination, of a promoter replacement fragment with a heterologous

CC promoter, so that expression of the second allele is regulated by the
CC promoter. (M1) is useful for constructing a strain of diploid fungal
CC cells in which both alleles of a gene are modified. The diploid fungal
CC cells having both alleles modified are useful for identifying a gene that
CC is essential to the survival or growth of a fungus, a gene that
CC contributes to the virulence and/or pathogenicity of a fungus, a gene
CC that contributes to the resistance of a diploid fungus to an antifungal
CC agent, an antifungal agent that inhibits the growth of a diploid fungus
CC and for identifying a therapeutic agent for treatment of a mammalian
CC disease. (M1) is useful for identifying a compound which modulates the
CC activity of a gene product, preferably enzymatic activity, carbon
CC compound catabolism, biosynthetic, transporter, transcriptional,
CC translational, signal transduction, DNA replication and cell division
CC activity. The method is useful for identifying a compound having the
CC ability to inhibit growth or proliferation of C. albicans cells and for
CC treating infection by C. albicans. The present sequence is that of a PCR
CC primer used in the method of the invention. Note: The sequence data for
CC this patent is not represented in the printed specification but is based
CC on sequence information supplied to Derwent by the European Patent Office

PT   Novel antisense compounds targeted to nucleic acids encoding caspase 7,
PT   for modulating gene expression and treating diseases associated with
PT   expression of caspase 7 in humans.
XX
PS   Claim 3; Page 86; 138pp; English.
XX
CC   The present invention describes a compound (I) 8-50 nucleobases in length
CC   targeted to a nucleic acid molecule encoding caspase 7, which
CC   specifically hybridises with and inhibits the expression of caspase 7.
CC   (I) has antiinflammatory and cytostatic activities, and can be used in
CC   antisense therapy and as an inhibitor of caspase 7 expression. (I) is
CC   useful for inhibiting the expression of caspase 7 in human cells or
CC   tissues, and for treating a human having a disease or condition
CC   associated with caspase 7 including inflammatory condition,
CC   hyperproliferative disorder (cancer), or bone metabolism or cholesterol
CC   disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as
CC   research reagent and kits. (I) is useful prophylactically to prevent or
CC   delay infection, inflammation or tumour formation. The present sequence
CC   represent a human caspase 7 inhibiting chimeric phosphorothioate
CC   oligonucleotide having 2'-MOE wings and a deoxy gap, which is used in an
CC   example from the present invention

PT   Identifying a compound that induces senescence in a mammalian p53
PT   deficient or tumor cell comprises assaying expression of cellular genes
PT   in the presence of the compound with expression of the genes in the
PT   absence of the compound.
XX
PS   Example 4; Page 51; 73pp; English.
XX
CC   The present invention describes a method for identifying a compound that
CC   induces senescence in a mammalian cell comprising culturing the cell in
CC   the presence and absence of the compound, assaying expression of at least
CC   one cellular gene (G1a) from 56 or a gene (G2) from 64 genes, with
CC   corresponding accession numbers given in the specification, and
CC   identifying compounds that induce senescence when expression of (G1a) or
CC   expression of (G2) is lower, in the presence of the compound. Also
CC   described: (1) a compound that induces senescence in a mammalian cell;
CC   (2) assessing efficacy of a treatment of a disease or condition relating
CC   to abnormal cell proliferation or neoplastic cell growth; (3) treating a
CC   disease or condition relating to abnormal cell proliferation or
CC   neoplastic cell growth; or (4) identifying a compound that inhibits
CC   senescence-associated induction of cellular gene expression. The compound
CC   is useful for treating or for assessing efficacy of treatment of a
CC   disease or condition relating to abnormal cell proliferation or
CC   neoplastic cell growth. The compound of the invention has a growth-
CC   inhibitory effect without producing systemic side effects found with
CC   other growth-inhibitory compounds. ABQ74611 to ABQ74734 represent PCR
CC   primers which are used in an example from the present invention

PT Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of
PT individuals e.g. by determining immunogenetic differences when
PT transplanting between them.
XX
PS Claim 22; Page 170; 345pp; Japanese.
XX
CC The invention relates to a typing kit for judging human leukocyte antigen
CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
CC oligonucleotides (ABL30512-ABL31809) originating in the sequences of
CC genes e.g. belonging to HLA class I antigens on human genome and
CC containing gene polymorphisms as alloantigens have been immobilised as
CC primers for amplification of cleaved nucleic acids relating to gene
CC polymorphisms. The method is useful for judging HLA genotypes of
CC individuals by determining immunogenetic differences before transplanting
CC between them, providing genetic information to decide compatibility of
CC organ and tissue for transplantation e.g. of bone marrow, kidney, liver,
CC pancreas, Langerhans islet in pancreas and cornea, susceptibility
CC diagnosis of genetic diseases and identifying individuals

PT Designing capture oligonucleotide probes for use on a support to which
PT complementary oligonucleotides hybridize with little mismatch.
XX
PS Example 5; Fig 29; 300pp; English.
XX
CC The present invention describes a method (M1) for designing capture
CC oligonucleotide probes (I) for use on a support to which complementary
CC oligonucleotide probes (II) will hybridise with little mismatch, where
CC (I) have melting temperatures within a narrow range. The method is useful
CC for detecting infectious diseases caused by bacterial infectious agents
CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC Epstein-Barr virus and polio virus, and parasitic infectious agents
CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus
CC medinesis. The method is also useful for detecting genetic diseases such
CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC involved in DNA amplification, replication, recombination or repair, the
CC cancer is specifically associated with a gene selected from BRCA1 gene,
CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
CC method is also used for environmental monitoring, forensics and the food
CC and feed industry, detecting comprises scanning (using e.g. a scanning
CC electron microscope and infrared microscope) the support at the
CC particular sites and identifying if ligation of the oligonucleotide probe
CC sets occurred and correlating (using a computer) identified ligation to a
CC presence or absence of the target nucleotide sequences. ABI82074 to
CC ABI97546 represent oligonucleotide sequences used in the exemplification
CC of the present invention

PT   Nucleic acid library comprising genes which are capable of initiation,
PT   progression and suppression of an immune response, especially an immune
PT   response observed with airway hyper-responsiveness of asthma.
XX
PS   Example 8; Page 76; 120pp; English.
XX
CC   The invention relates to a nucleic acid library comprising genes or their
CC   fragments which are capable of modulating an immune response observed
CC   with airway hyperresponsiveness and/or bronchoalveolar manifestations of
CC   asthma. Also included are a method for modulating an immune response of
CC   an individual comprising modulating a gene comprising a nucleic acid at
CC   least functionally equivalent to a nucleic acid identifiable by a
CC   signature sequence (SS) given in the specification such as R1-SO-R1-A11,
CC   StO1-A10, SvO2-1-C11, StO1-A12, and R1-SO-R1-B7, a substance (for use as
CC   a medicament) capable of modulating a gene comprising a nucleic acid at
CC   least functionally equivalent to a nucleic acid identifiable by SS and
CC   the use of a proteinaceous substance derived from a nucleic acid at least
CC   functionally equivalent to a nucleic acid identifiable by SS for the
CC   production of an antagonist (for use as a medicament) against the
CC   substance. The antagonist and substance are useful for the treatment of
CC   an immune response observed with airway hyperresponsiveness and/or
CC   bronchoalveolar manifestations of asthma. The method is useful for
CC   modulating the above immune response, where the gene encodes a gene
CC   product capable of modulating the immune response. The substance is
CC   useful for treating an immune response, particularly asthma, chronic
CC   obstructive pulmonary disease (COPD), allergic diseases (rhinitis, atopic
CC   dermatitis, urticaria), autoimmune diseases (e.g. multiple sclerosis),
CC   inflammatory bowel disease, allograft rejection and infectious disease.
CC   The present sequence is a PCR primer used to amplify and/or characterise
CC   a mouse signature sequence of the invention

PT   New antisense oligonucleotides targeted to nucleic acid encoding Casein
PT   kinase 2-beta, useful in diagnostic and research applications, or for
PT   treating a disease or condition associated with the expression of Casein
PT   kinase 2-beta.
XX
PS   Example 15; Page 91; 142pp; English.
XX
CC   The invention relates to a compound that is 8 - 50 nucleobases in length
CC   targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and
CC   which specifically hybridises with and inhibits the expression of Casein
CC   kinase 2-beta, or which specifically hybridises with an 8-nucleobase
CC   portion of an active site on a nucleic acid molecule encoding Casein
CC   kinase 2-beta. Also included are: (1) a composition comprising the
CC   compound, and a carrier or diluent; (2) inhibiting the expression of
CC   Casein kinase 2-beta in cells or tissues by contacting the cells or
CC   tissues with the compound so that the expression of Casein kinase 2-beta
CC   is inhibited; and (3) treating an animal having a disease or condition
CC   associated with Casein kinase 2-beta by administering to the animal the
CC   new compound so that the expression of Casein kinase 2-beta is inhibited.
CC   The antisense compounds are useful for modulating the expression of
CC   Casein kinase 2-beta and for treating diseases or conditions associated
CC   with expression of Casein kinase 2-beta, e.g. diabetes or
CC   hyperproliferative disorders, particularly cancer, such as breast cancer,
CC   prostate cancer, or liver cancer. The antisense compounds are also useful
CC   for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay
CC   infection, inflammation or tumour formation, as research reagents and
CC   kits, and in distinguishing between functions of various members of a
CC   biological pathway. The present sequence is an antisense oligonucleotide
CC   of the invention targeting human casein kinase 2-beta

PT   Screening and identifying nucleic acids encoding signal transducers with
PT   chimeric molecules, for use in studying and regulating cell
PT   proliferation, development and differentiation of organisms, and defense
PT   mechanism.
XX
PS   Example 1; Page 20; 55pp; Japanese.
XX
CC   The invention relates to a novel method for screening nucleic acids
CC   relating to signal transduction. The method comprises using a chimeric
CC   molecule provided with a receptor for transfer of an extracellular domain
CC   as an extracellular signal into a cell, and an intracellular domain as an
CC   extracellular signal into a cell, and an intracellular domain as the test
CC   nucleic acid product. The method of the invention is useful for screening
CC   and identifying nucleic acids encoding signal transducers, which are for
CC   use in studying and regulating cell proliferation, development and
CC   differentiation of organisms, and defense mechanisms against external
CC   factors and stress via their signal transduction path. This sequence
CC   represents an oligonucleotide relating to the novel method of the
CC   invention

PT   New antisense compounds targeted to nucleic acids encoding human
PT   bifunctional apoptosis regulator, for modulating expression of the
PT   regulator and treating diseases associated with expression of the
PT   regulator in humans.
XX
PS   Claim 3; Col 45-46; 42pp; English.
XX
CC   This invention describes a novel compound, 17-50 nucleobases in length
CC   which specifically hybridises with a nucleic acid encoding human
CC   bifunctional apoptosis regulator (BAR) and inhibits the expression of
CC   human BAR. The products of the invention have cytostatic and
CC   antiinflammatory activity and can be used to inhibit human BAR expression
CC   during antisense therapy, useful for inhibiting the expression of human
CC   BAR in cells or tissues and for treating diseases associated with
CC   expression of BAR in an animal, particularly a human suspected of having
CC   or being prone to a disease or condition associated with expression of
CC   human BAR. In addition the antisense oligonucleotides are useful for
CC   diagnostics, therapeutics and as research reagent, e.g. prophylactically
CC   to prevent or delay infection, inflammation or tumor formation. The
CC   oligonucleotides described in the invention have 2'-methoxyethyl (2'-MOE)
CC   wings and a deoxy gap. This sequence represents a human BAR antisense
CC   oligonucleotide described in the disclosure of the invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 3844; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13835; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Claim 15; SEQ ID NO 808; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PS Claim 7; Page 29; 94pp; Japanese.
XX
CC The present invention describes a polynucleotide probe, or primer, for
CC detecting beer-clouding lactic acid bacteria containing a nucleotide
CC sequence of (I) with 8056 base pairs (see ABZ76501), or a nucleotide made
CC from not less than 15 nucleotides hybridisable with its complementary
CC sequence. Probes and primers from the present invention can be used for
CC detecting beer-clouding lactic acid bacteria (Lactobacillus brevis) for
CC quality control during beer production, which is applicable in the
CC brewing industry. The present sequence represents a PCR primer for
CC Lactobacillus brevis which is used in the exemplification of the present
CC invention

```
PT   disease states in humans and animals, and as research reagents and
PT   diagnostics.
XX
PS   Claim 3; Col 45; 42pp; English.
XX
CC   The invention relates to an antisense compound 20-50 nucleobases in
CC   length targeted to a start codon region, coding region, a stop codon
CC   region or a 3'-untranslated region of a nucleic acid molecule encoding
CC   human Interleukin 12 p40 subunit. The compound specifically hybridises
CC   with one of the regions and inhibits the expression of human Interleukin
CC   12 p40 subunit. The new compound is useful for inhibiting the expression
CC   of human Interleukin 12 p40 subunit in cells or tissues and comprises
CC   contacting the cells or tissues in vitro with the compound, so that
CC   expression of the human Interleukin 12 p40 subunit is inhibited. The
CC   antisense compound may also be used as research reagents and diagnostics,
CC   and as treatment or prevention of disease states, e.g. to prevent or
CC   delay infection, inflammation or tumour formation, in animals and humans.
CC   The present sequence is an antisense oligonucleotide of the invention

PT   New nucleic acid sequence comprising DPP10 mRNA, useful for the
PT   manufacture of a medicament for regulating DPP10 protein expression or
PT   for preventing or treating inflammatory disease e.g., inflammatory bowel
PT   disease.
XX
```

```
PS   Disclosure; Page 321; 321pp; English.
XX
CC   The present invention describes a new isolated nucleic acid sequence (I)
CC   comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also
CC   known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic,
CC   antipsoriatic, antiarthritic and antirheumatic activities, and can be
CC   used in vaccines and gene therapy. A composition comprising (I) can be
CC   used for the manufacture of a medicament for regulating DPP10 expression
CC   or for preventing or treating inflammatory disease e.g., inflammatory
CC   bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can
CC   also be used in an assay for detecting or measuring DPP10 in a sample. A
CC   host cell comprising (I) can be used for producing recombinant DPP10 gene
CC   products, or in drug screening systems to identify agents for diagnosis
CC   or treatment of individuals having or susceptible to inflammatory
CC   disease. Human DPP10 is located on chromosome 2, more specifically
CC   chromosome 2q14. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent
CC   sequences used in the exemplification of the present invention

PT   New antisense oligonucleotides targeted to nucleic acids encoding thyroid
PT   hormone receptor interactor 6, useful for diagnosing or treating
PT   hyperproliferative disorders, such as cancer.
XX
PS   Example 15; Page 77; 111pp; English.
XX
CC   The invention relates to antisense compounds targetted to a nucleic acid
CC   encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its
CC   expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and
CC   zyxin-related protein-1 (ZRP-1). TRIP6 DNA is located on chromosome 7q22.
CC   Antisense compounds of the invention are useful for modulating the
CC   expression of TRIP6 and for treating diseases or conditions associated
CC   with the expression of TRIP6 such as hyperproliferative disorders (e.g.
CC   cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g.
CC   to prevent or delay infection, inflammation or tumour formation, as
CC   research reagents and kits and in distinguishing between functions of
CC   various members of a biological pathway. The are also useful in antisense
CC   therapy. The present sequence is an antisense oligo targetted to human
CC   TRIP6 DNA. This oligo is used in the exemplification of the invention

PT   Novel antisense oligonucleotide which is targeted to mRNA encoding human
PT   raf and which is capable of inhibiting raf expression, useful for
```

```
PT   treating or preventing hyperproliferative conditions such as cancer.
XX
PS   Example 18; Page 14; 42pp; English.
XX
CC   The invention relates to an oligonucleotide 8-50 nucleotides in length
CC   which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a
CC   protein kinase playing a regulatory role in signal transduction,
CC   regulating cell proliferation and has been implicated in lung carcinoma),
CC   and which is capable of inhibiting raf expression. Also included is a
CC   composition comprising the oligonucleotide and a pharmaceutically
CC   acceptable carrier. The antisense oligonucleotide is useful for
CC   inhibiting the expression of human raf in human cells or tissues, by
CC   contacting the human cells or tissues with the oligo. The oligo. is also
CC   is useful for treating or preventing a disease or condition associated
CC   with the expression of raf by administering it in combination with a
CC   chemotherapeutic agent to a human or cells of the human, where the
CC   expression of raf is abnormal expression, and the condition is a
CC   hyperproliferative condition such as cancer, angiogenesis or
CC   neovascularisation (preferably ocular angiogenesis or
CC   neovascularisation). The oligo. is also useful for inhibiting
CC   hyperproliferation of cells. The oligos. are also useful as tools, for
CC   example for detecting and determining the role of raf expression in
CC   various cell functions and physiological processes and conditions and for
CC   diagnosing conditions associated with raf expression and for research
CC   purposes. The present sequence is an antisense oligonucleotide targeting
CC   a human raf mRNA

PT   Composition comprising an antisense oligonucleotide targeted to nucleic
PT   acids encoding human ras, and capable of inhibiting ras expression,
PT   useful for treating or preventing colorectal cancer, melanoma, or
PT   sarcoma.
XX
PS   Disclosure; Page 13; 46pp; English.
XX
CC   The invention relates to a composition comprising an oligonucleotide
CC   which is targeted to a nucleic acid encoding human ras, which is capable
CC   of inhibiting ras expression, and at least one chemotherapeutic agent.
CC   The composition is useful for modulating the expression of human ras in
CC   tissues or cells containing a ras gene. The compostion is also useful for
CC   inhibiting the proliferation of cancer cells, where the cancer cells are
CC   blood cells, preferably peripheral blood mononuclear cells. The
CC   composition is useful for treating or preventing a condition arising from
CC   the activation of ras oncogene which involves contacting an animal
CC   suspected of having a condition (e.g. hyperproliferative condition such
CC   as cancer preferably colorectal cancer, melanoma, liposarcoma,
CC   mesothelioma, sarcoma, colon cancer or pancreatic cancer) arising from
CC   the activation of ras oncogene such as abnormal expression of the ras
CC   oncogene. The present sequence represents a human ras antisense
CC   oligonucleotide

PT   New compound having sequence targeted to nucleic acid encoding inhibitor-
PT   kappa B kinase-gamma, useful for preparing composition for treating e.g.,
PT   cancer, or inflammatory or autoimmune disorder.
XX
PS   Example 15; Page 77; 106pp; English.
XX
CC   The invention relates to an antisense compound that is targeted to a
CC   nucleic acid encoding inhibitor-kappa B kinase-gamma, specifically
CC   hybridising to the nucleic acid encoding inhibitor-kappa B kinase-gamma
CC   and inhibiting its expression. Compounds of the invention are antisense
CC   oligonucleotides comprising at least one modified internucleoside
CC   linkage, which is a phosphorothioate linkage, at least one modified sugar
CC   moiety, which is a 2'-O-methoxyethyl sugar moiety, or at least one
CC   modified nucleobase, which is a 5-methylcytosine. Preferably, the
CC   antisense oligonucleotide is a chimeric oligonucleotide. The compound of
CC   the invention is useful for preparing a composition for treating a
CC   hyperproliferative disorder e.g., cancer, or an autoimmune or
CC   inflammatory disorder. The methods are useful for inhibiting the
CC   expression of inhibitor-kappa B kinase-gamma in cells or tissues, and
CC   treating an animal having a disease or condition associated with
CC   inhibitor-kappa B kinase-gamma. Sequences given in ADA44713-ADA44790
CC   represent antisense oligonucleotides for the inhibition of human
CC   inhibitor-kappa B kinase-gamma mRNA levels.

PS   Example 7; Page 82; 133pp; English.
XX
CC   The present sequence is that of a forward primer that was used in the
CC   mapping of the human vascular endothelial growth inhibitor (VEGI) gene. 4
CC   Human VEGI isoforms have been identified: novel VEGI-192a and VEGI-192b,
CC   and previously known VEGI-251 and VEGI-174 (see ABR42579-82). The
CC   invention provides angiogenesis inhibitors comprising VEGI-192a, VEGI-
CC   192b or VEGI-251 polynucleotides, polypeptides or derivatives, useful for
CC   treatment of cancer or suppression of tumour growth. Also provided are
CC   accelerators of angiogenesis, e.g. an antibody, antisense
CC   oligonucleotide, antagonist or ribozyme that reduces or eliminates VEGI-
CC   192a, VEGI-192b or VEGI-251 function, useful e.g. for wound healing

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding KSR, useful for treating a disease/condition
PT   associated with KSR, such as hyperproliferative or developmental
PT   disorders.
XX
PS   Claim 3; Page 75; 102pp; English.
XX
CC   The present invention describes a compound 8-50 nucleobases in length
CC   targeted to, and which specifically hybridises with a nucleic acid
CC   molecule encoding kinase suppressor of ras-1 (KSR), and inhibits the
CC   expression of KSR. Also described: (1) a compound 8-50 nucleobases in
CC   length that specifically hybridises with at least an 8-nucleobase portion
CC   of an active site on a nucleic acid molecule encoding KSR; (2) a
CC   composition comprising the compound and a carrier or diluent; (3)
CC   inhibiting the expression of KSR in cells or tissues by contacting the
CC   cells or tissues with the compound so that expression of KSR is inhibited
CC   ; and (4) treating an animal having a disease or condition associated
CC   with KSR by administering to the animal a therapeutic or prophylactic
CC   amount of the compound so that expression of KSR is inhibited. The
CC   compound has cytostatic activity and can be used as a KSR inhibitor, and
CC   in antisense gene therapy. The compound, composition and methods are
CC   useful for treating a disease or condition associated with KSR, such as a
CC   hyperproliferative or developmental disorder, or a disease or condition
CC   arising from aberrant apoptosis by inhibiting the expression of KSR. They
CC   are also useful in research and diagnostics for modulating the expression
CC   of KSR. The present sequence represents a chimeric phosphorothioate
CC   antisense oligonucleotide of human KSR, which is used in an example from
CC   the present invention

PT   New orally acceptable immunogenic composition comprising unpurified or
PT   partially purified recombinant HCV, IBDV, IBV, ILTV or PRRSV immunogen
PT   expressed in a plant, useful for producing an immunogenic response
PT   against the antigen.
XX
PS   Example 5; Page 97; 146pp; English.
XX
CC   The invention relates to a new orally acceptable immunogenic composition
CC   comprising unpurified or partially purified recombinant HCV (Hog cholera
CC   virus), IBDV (Infectious Bursal Disease Virus), IBV (infectious
CC   bronchitis virus), ILTV or PRRSV (porcine reproductive and respiratory
CC   syndrome virus) immunogen expressed in a plant, where the immunogen is
CC   expressed in the plant at a level so that upon oral administration of the
CC   composition to an animal, an immunogenic response is observed. The
CC   composition is useful for producing an immunogenic response against HCV,
CC   IBDV, IBV, ILTV or PRRSV antigen. Sequences ABZ76423-28 represent
CC   primers, based on the ORF1b encoding the polymerase protein, used for PCR
CC   amplification and typing of PRRSV

XX
PT   New antisense oligonucleotides targeted to a nucleic acid encoding acyl
PT   coenzyme A cholesterol acyltransferase-1, useful for treating a
PT   disease/condition involving abnormal lipid or cholesterol metabolism,
PT   e.g. atherosclerosis.
XX
PS   Claim 3; Page 91; 117pp; English.
XX
CC   Sequences ABZ74897-ABZ74942 represent antisense oligonucleotides targeted
CC   to the human or murine acyl coenzyme A cholesterol acyltransferase-1
CC   gene, which inhibit its expression. The antisense oligonucleotides were
CC   designed to target different regions of the human or murine acyl coenzyme
CC   A cholesterol acyltransferase-1 RNA, and were analysed for their effect
CC   on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by
CC   quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase
CC   (ACAT) enzymes catalyse the synthesis of cholesterol esters from free
CC   cholesterol and fatty acyl-CoA, and are also involved in regulating the
CC   concentration of cellular free sterols. The human acyl coenzyme A
CC   cholesterol acyltransferase-1 is the predominant ACAT isoform in the
CC   liver, and the gene encoding it is located on chromosome 1q25, although a
CC   subsequent study has indicated that one acyl coenzyme A cholesterol
CC   acyltransferase-1 mRNA is produced from genes on two different
CC   chromosomes (chromosomes 1 and 7) by a novel RNA recombination mechanism
CC   involving trans-splicing of the two discontinuous precursor mRNAs. The
CC   oligonucleotides of the invention are useful for the prevention and
CC   treatment of conditions associated with acyl coenzyme A cholesterol
CC   acyltransferase-1, such as disorders involving abnormal lipid or
CC   cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of acyl coenzyme A cholesterol acyltransferase-1

PT   New oligonucleotides which hybridizes to, and modulates the expression of
PT   Jun N-terminal kinase, useful for treating a disease or condition
PT   characterized by a reduction in apoptosis, e.g. prostate cancer,
PT   inflammation or fibrosis.
XX
PS   Example 3; Page 20; 69pp; English.
XX
CC   The invention relates to an oligonucleotide (antisense, AS) comprising 8-
CC   30 nucleotides connected by covalent linkages, where the oligonucleotide
CC   has a sequence specifically hybridisable with a nucleic acid encoding a
CC   Jun N-terminal kinase (JNK) protein and modulates the expression of the
CC   JNK protein. Also included are a pharmaceutical composition comprising
CC   the AS oligonucleotide (or its bioequivalent, and a pharmaceutical
CC   carrier), treating an animal having/suspected of having/prone to having a
CC   hyperproliferative disease (by administering to a prophylactic or
CC   therapeutic amount of the composition of the AS oligonucleotide),
CC   modulating the expression of a JNK protein in cells or tissues by
CC   contacting the cells or tissues with the AS oligonucleotide, modulating
CC   the cell cycle progression (or the phosphorylation of a protein
CC   phosphorylated by a JNK protein, or expression of a cellular protein that
CC   promotes one or more metastatic events in cultured cells or the cells of
CC   an animal) by administering the oligonucleotide to the cells, inhibiting
CC   the growth of a tumour in an animal by administering the oligonucleotide,
CC   inducing apoptosis in a cell by contacting a cell with an AS
CC   oligonucleotide for JNK2 and treating a human having a disease or
CC   condition associated with a JNK protein or characterised by a reduction
CC   in apoptosis by administering a prophylactic or therapeutic amount of the
CC   AS oligonucleotide. The antisense oligonucleotide is useful for treating
CC   a disease or condition characterised by a reduction in apoptosis, such as
CC   prostate cancer or prostate tumour, inflammation, fibrosis or fibrotic
CC   disease or condition (e.g. fibrotic scarring, peritoneal adhesions, lung
CC   fibrosis or conjunctival scarring), hyperproliferative disease or
CC   condition, such as cancer. The antisense oligonucleotides may also be
CC   used as research agents and diagnostic aids, to detect the presence of
CC   JNK protein-specific nucleic acids in a cell or tissue sample, and to
CC   study the function of one or more genes in the animal. The present
CC   sequence is an antisense oligonucleotide targeting human JNK1.

PT   Amplifying expressed genetic sequences from genomic DNA of mammalian or
PT   higher order plant species for printing on DNA microarrays, involves
PT   using the 3' untranslated region of the gene sequence.
XX
PS   Disclosure; Page 7; 15pp; English.
XX
CC   The invention discloses a method for amplifying expressed genetic
CC   sequences from genomic DNA (gDNA) from mammalian or higher order plant
CC   species. The method involves identifying a 3' untranslated region (UTR)
CC   of a gDNA sequence, designing probe, performing PCR, separating the
CC   product by size differentiation and performing a second PCR to amplify
CC   the predetermined sequence. Also claimed is a biological analysis device,
CC   comprising a substrate and an array of a set of expressed genetic
CC   sequences, located on the substrate, which are generated by the method
CC   above and a DNA high-density microarray comprising a substrate upon which
CC   are deposited an array of biosites of genomic DNA fragments having the
CC   sequence of at least one exon, and absent polyadenine and vector
CC   sequences, where the genomic DNA fragments have a sequence length of from
CC   about 75-2000 nucleotides. The method is efficient for amplifying gene
CC   sequences, enables large-scale production of gDNA sequences, generates
CC   large quantities of gDNA probes, which enables greater efficiency for
CC   printing in microarray formats, fabricates high-density DNA arrays of
CC   enhanced, widely varying genetic content and abstains from using RNA-
CC   derived sequences by simple PCR amplifications without cloning. The
CC   method produces amplified sequences that have greater specificity and
CC   size consistency than that observed with cDNA fragments, and allows for
CC   greater signal sensitivity than oligonucleotides. The sequence presented
CC   is a Type II gene specific primer

PT Production of chimeric non-human animal expressing a specific protein,
PT useful for functional analysis of the protein.
XX
PS Example 17; SEQ ID NO 28; 108pp; Japanese.
XX
CC The invention relates to the production of a chimeric non-human animal
CC expressing a specific protein. The method of the invention comprises
CC preparing cells of the animal which contain in their genome a sequence
CC encoding the specific protein, inserting the cells into a host embryo of
CC the non-human animal, implanting the chimeric embryo obtained into a host
CC animal, and selecting from the offspring of the host animal those
CC expressing the specific protein. The promoter sequence and the sequence
CC encoding the specific protein are downstream of an internal ribosomal
CC entry site downstream of the stop codon of a gene expressed in the
CC nominated cells or tissues, and upstream of a poly-A signal region. The
CC distance between the poly-A sequence of the upstream gene and the
CC promoter sequence is not more than 1kb. The cells capable of
CC differentiation are preferably embryonic stem cells. The non-human animal
CC is preferably a mouse, but may be a rat, pig, cow, monkey, sheep, goat,
CC rabbit or hamster. The protein is especially light or heavy chain
CC Immunoglobulin (Ig) G in B-cells, T cell receptor in T-cells, myoglobin
CC in skeletal muscle cells, crystallin in the aqueous humor of the eye,
CC renin in kidney tissue, albumin in liver tissue and lipase in pancreas
CC tissue. The method is useful for the functional analysis of the specific
CC protein by comparison of the phenotype of the chimeric animal with that
CC of the corresponding wild-type animal. The current sequence represents a
CC synthetic oligonucleotide related to FGF23 that is used in an example
CC from the invention.

PT Use of a compound capable of modulating the level of activity of the OAS,
PT RNase L or 2'-5' phosphodiesterase gene or protein in the manufacture of
PT a medicament for treating a patient with or at risk of hepatitis C
PT infection.
XX
PS Example 1; Page 43; 67pp; English.
XX
CC The invention relates to a novel compound capable of modulating the level
CC of activity of the 2',5'-oligoadenylate synthetase (OAS), RNase L or 2'-
CC 5' phosphodiesterase gene or protein, useful in the manufacture of a
CC medicament for treating a patient with or at risk of hepatitis C
CC infection, where the compound is not an interferon or an isoprenoid, such
CC as geranylgeranylacetone (GGA). The method of the invention has virucide
CC and hepatotropic activity. A polynucleotide of the invention may have a
CC use in gene therapy, or in a vaccine. The compound capable of modulating
CC the level of activity of the OAS, RNase L or 2'-5' phosphodiesterase gene
CC and/or activity of the OAS, RNase L or 2'-5' phosphodiesterase protein is
CC useful in the manufacture of a medicament for treating a patient with or
CC at risk of hepatitis C infection. The nucleic acid that hybridises
CC selectively to OAS nucleic acid is useful in the manufacture of a
CC medicament or diagnostic reagent for treating or diagnosing a patient
CC with or at risk of hepatitis C infection. The present sequence is used in
CC the exemplification of the invention.

PT Determining a predisposition for or the occurrence of neurodegenerative
PT disease, e.g. Alzheimer's disease by detecting in a target nucleic acid
PT the presence or absence of an allelic variant of one or more polymorphic
PT regions.
XX
PS Example 3; Page 287; 848pp; English.
XX
CC The present invention relates to a method (M1) for determining a
CC predisposition for or the occurrence of neurodegenerative disease in a
CC subject. The method comprises detecting in a target nucleic acid obtained
CC from the subject the presence or absence of an allelic variant of one or
CC more polymorphic regions of one or more genes selected from uPA
CC (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulin-
CC degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid
CC lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the
CC presence of at least one of the allelic variant of one or more
CC polymorphic regions is indicative of a predisposition for or the
CC occurrence of neurodegenerative disease. The genes are all located on
CC chromosome 10. M1 is useful for determining a predisposition for or the

```
CC   occurrence of, and for treating neurodegenerative disease, particularly
CC   Alzheimer's disease. The present sequence is a PCR primer, which was used
CC   in the method of the invention.

PT   Determining a predisposition for or the occurrence of neurodegenerative
PT   disease, e.g. Alzheimer's disease by detecting in a target nucleic acid
PT   the presence or absence of an allelic variant of one or more polymorphic
PT   regions.
XX
PS   Example 3; Page 290; 848pp; English.
XX
CC   The present invention relates to a method (M1) for determining a
CC   predisposition for or the occurrence of neurodegenerative disease in a
CC   subject. The method comprises detecting in a target nucleic acid obtained
CC   from the subject the presence or absence of an allelic variant of one or
CC   more polymorphic regions of one or more genes selected from uPA
CC   (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulin-
CC   degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid
CC   lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the
CC   presence of at least one of the allelic variant of one or more
CC   polymorphic regions is indicative of a predisposition for or the
CC   occurrence of neurodegenerative disease. The genes are all located on
CC   chromosome 10. M1 is useful for determining a predisposition for or the
CC   occurrence of, and for treating neurodegenerative disease, particularly
CC   Alzheimer's disease. The present sequence is a PCR primer, which was used
CC   in the method of the invention.

PT   Assay of genetic sequences based on triplex formation from double
PT   stranded analyte - and hybrid of anchor and reporter sequences, with
PT   reporter released if triplex formation occurs, used e.g. to identify
PT   bacteria.
XX
PS   Disclosure; Col 17-18; 168pp; English.
XX
CC   The present sequence represents a polynucleotide that is able to form a
CC   triple helix with a double stranded sequence. Cytosine bases in the
CC   present can be replaced with 5-methylcytosine for increased triplex
CC   stability. The present sequence is used in the assay of the invention,
CC   where it can be part of the anchor DNA or reporter DNA sequence. The
CC   assay comprises adding a sample containing double-stranded DNA test
CC   sequences to an aqueous medium containing at least one complex of anchor
CC   DNA, attached to a solid support, and reporter DNA, where either a part
CC   of the anchor DNA or reporter DNA is designed to form a triple-strand
CC   structure with part of the test sequence. Triplex formation results in
CC   displacement of the reporter DNA which is detected as an indication of
CC   the presence of the DNA test sequence. The method is used to detect DNA
CC   sequences, particularly for identification of bacteria (by detecting
CC   genes for ribosomal RNA) in clinical samples, but also detection of
CC   oncogenes and Hepatitis B virus

PT DNA encoding maize di:hydro:di:picolinic acid synthase mutant - resistant
PT to feedback inhibition by lysine.
XX
PS Example 7; Col 20; 35pp; English.
XX
CC AAT42552-T42561 represent amplification primers for the recombinant DNA
CC sequence used in the method of the invention. The method of the invention
CC is for increasing the level of L-Lysine in a plant. In the method, a
CC recombinant DNA sequence is introduced into the cells of a plant tissue
CC source. The recombinant sequence comprises an altered mature Zea mays
CC dihydrodipicolinic acid (DHPS) sequence (see AAT42547) which is
CC substantially resistant to feedback inhibition by endogenously produced
CC free L-Lysine, and a second sequence which encodes a chloroplast transit
CC sequence (see AAT42549). The DHPS used has at least one amino acid
CC alteration contained within residues 100-125, and is more than 400 times
CC less sensitive to lysine than wild-type DHPS. The chloroplast transit
CC sequence localises the altered mature DHPS in the chloroplasts of the
CC plant cells. The transfected plant cells are then used to generate plants
CC expressing the recombinant DNA in their cells. The plants regenerated
CC from the transformed cells have increased levels of free L-Lysine, which
CC improves their nutritional value. The plants which can be improved by
CC this transformation include maize and other grain crops, forage plants
CC (such as clover, fescue, and alfalfa), and processed plants (such as
CC tomatoes, soyabeans and lupins). The plants can be used directly as feed
CC or food, or the L-Lysine can be extracted for use as a feed or food
CC additive

PT   oligo:nucleotide, opt. carrying a mutagen, partic. for treatment of
PT   sickle cell anaemia or thalassemia.
XX
PS   Claim 34; Page 45; 70pp; English.
XX
CC   A third-strand binding site (AAT48456) is located in the second intron of
CC   the human beta-globin gene, beginning at position 2825 of the sequence
CC   given in AAT48454. It comprises 21 uninterrupted pyrimidines in the
CC   coding strand. Third-strand binding sites (see also AAT48455-59) can be
CC   used in targetted DNA replacement (TDR). This method for genetic defect
CC   repair involves targetting third strands (see also AAT48467-70) to native
CC   DNA sequences to induce DNA damage that stimulates homologous
CC   recombination with an introduced donor nucleic acid strand. The method is
CC   used to correct mutations in a target region, esp. for treatment of beta-
CC   thalassaemia and sickle cell anaemia. TDR is highly specific and, since
CC   the corrected gene is in its native chromosome, the cure is permanent

PT Detecting mutation(s) in the BRCA1 gene by exon amplification - then
PT comparing amplification products with those from wild type gene,
PT optionally followed by sequencing.
XX
PS Claim 15; Page 11; 65pp; English.
XX
CC PCR primers AAV05204-05 are used to amplify exon 9 of the BRCA1 gene. A
CC fragment of 197 bp is produced. The primers are used in a method for
CC identifying mutations in the BRCA1 gene using a multiplex amplification
CC process. BRCA1 mutations are associated with ovarian and breast cancer. A
CC sample is tested for mutations in the BRCA1 gene by amplifying at least
CC one (partial) exon of the gene, and comparing the sizes and amounts of
CC amplification products with corresponding products of the wild-type gene.
CC Any differences indicate a mutation. If no mutations are detected, the
CC sequence of at least one exon may be determined. This method is
CC inexpensive enough to be used for large scale diagnostic screening

XX
CC Primers hTSCex17 forward and reverse (see AAV40599 and AAV40600,
CC respectively) are designed to amplify exon 17 of the human hTSC gene (see
CC AAV40561) that codes for thiazide-sensitive Na-Cl cotransporter TSC (see
CC AAW29682). Both primers are located within introns of hTSC. 27 Sets of
CC specific primers (see AAV40565-V40618) were used for SSCP analysis of
CC hTSC. Amplified products were analysed for molecular variants by
CC electrophoresis, and identified variants were sequenced. Complete linkage
CC of Gitelman's syndrome with TSC was demonstrated. Identification of the
CC molecular basis of Gitelman's syndrome allows for the genetic diagnosis
CC of this disorder. The invention provides products and methods useful for
CC diagnosis and treatment of Gitelman's syndrome and other ion transport
CC disorders

CC This invention describes a novel method for identifying an inhibitor

CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent

XX
CC   The present sequence represents a polynucleotide that is able to form a
CC   triple helix with a double stranded sequence. Cytosine bases in the
CC   present can be replaced with 5-methylcytosine for increased triplex
CC   stability. The present sequence is used in the assay of the invention,
CC   where it can be part of the anchor DNA or reporter DNA sequence. The
CC   assay comprises adding a sample containing double-stranded DNA test
CC   sequences to an aqueous medium containing at least one complex of anchor
CC   DNA, attached to a solid support, and reporter DNA, where either a part
CC   of the anchor DNA or reporter DNA is designed to form a triple-strand
```

```
CC   structure with part of the test sequence. Triplex formation results in
CC   displacement of the reporter DNA which is detected as an indication of
CC   the presence of the DNA test sequence. The method is used to detect DNA
CC   sequences, particularly for identification of bacteria (by detecting
CC   genes for ribosomal RNA) in clinical samples, but also detection of
CC   oncogenes and Hepatitis B virus

PT   Production of antisense libraries, used for identifying antisense agents
PT   and for identifying target sites for antisense-mediated inhibition of a
PT   selected gene.
XX
PS   Example 4; Page 60; 63pp; English.
XX
CC   This invention describes a novel method for generating an antisense
CC   library targeted to a selected RNA transcript. The methods can be used
CC   for identifying antisense agents and for identifying target sites for
CC   antisense-mediated inhibition of a selected gene. The use of a direct
CC   library for target site selection significantly simplifies the screening
CC   process, since only very small libraries need be prepared and assayed.
CC   AAZ23783-Z23798 represent RNA fragments derived from the Herpes simplex
CC   virus genome which are used to illustrate the method of the invention

PT   Mammalian asthma related genes, useful for diagnosis of a predisposition
PT   to development of asthma.
XX
PS   Disclosure; Page 63; 195pp; English.
XX
CC   The invention identifies a genetic locus ASTH1, associated with asthma,
CC   mapped to human chromosome 11p. ASTH1I and ASTHIJ are genes present
CC   within the locus, located close to each other on human chromosome 11p,
CC   and have similar patterns of expression, and common sequence motifs. The
CC   ASTH1 genes and fragments, encoded protein, genomic regulatory regions
CC   and anti-ASTH1 antibodies are useful in the identification of individuals
CC   predisposed to development of asthma, and for the modulation of gene
CC   activity in vivo for prophylactic and therapeutic purposes. The ASTH1
CC   protein is useful as an immunogen to raise specific antibodies, in drug
CC   screening for compositions that mimic or modulate ASTH1 activity or
CC   expression, including altered forms of ASTH1 protein, and as a
CC   therapeutic. Sequences AAZ18366-Z18509 represent polymorphisms in the
CC   ASTH1I and ASTH1J genes

XX
PT   Use of a prostate cancer associated gene and biallelic markers derived
PT   from it.
XX
PS   Claim 4; Page 357; 385pp; English.
XX
CC   The invention relates to a mammalian PG1 gene and protein, and a set of
CC   PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC   used in a hybridisation assay, a sequencing assay, or in an allele-
CC   specific amplification assay for determining the identity of a nucleotide
CC   at a PG1-related biallelic marker. The methods can be used to detect and
CC   to assess the risk of developing cancer or prostate cancer. Early-stage
CC   diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC   dosage. However, the effectiveness of this is limited due to its
CC   inability to discriminate between malignant and non-malignant affections
CC   of the organ. A need exists for both a reliable diagnostic procedure
CC   which would enable early-stage diagnosis, and for preventative and
CC   curative treatments of the disease. The PG1 gene can be used for
CC   detection of prostate cancer, and the risk of developing it in the
CC   future, and can also be used to determine therapies for the disease

PT   Methylated CpG island amplification (MCA) used to determine DNA
PT   methylation status of CpG sites in a given locus, useful for diagnosis of
PT   age-related disorders e.g. colon cancer and dementia.
XX
PS   Example 8; Page 69; 100pp; English.
XX
CC   The patent discloses a method known as Methylated CpG island (CGI)
CC   Amplification (MCA) to identify methylated CpG sites (cytosine residues
CC   5' of neighbouring guanine). The method uses a methylation-sensitive
CC   restriction endonuclease SmaI, that cleaves unmethylated CpG sites and
CC   its isoschizomer XmaI, that cleaves both methylated and unmethylated
CC   CGIs. It involves amplification of closely spaced methylated SmaI sites.
CC   This method is used to determine the DNA methylation status of CpG sites
CC   in a given locus, in normal and neoplastic cells. It can be used for
CC   diagnosis of age-related disorders, associated with methylation of CGIs,
CC   e.g. dementia, artherosclerosis and diabetes mellitus, cell proliferative
CC   disorders, e.g. cancer of the kidney, colon, breast, uterus, prostate and
CC   lung, leukaemia, glioblastoma, astrocytoma and neuroblastoma. It is also
CC   used to evaluate the cell response to a methylation modulating agent. It
CC   can also be used to screen samples for the presence of hypermethylation
CC   of specific genes. The present DNA sequence is the human MINT1 clone
CC   (Methylated IN Tumour) specific PCR primer-1, used for amplification and
CC   bisulphite-restriction methylation analysis

PT   Novel nucleic acid used for genotyping, e.g. to predict rate of drug
PT   metabolism.
XX
PS   Claim 2; Page 16; 46pp; English.
XX
CC   Sequences AAZ59305-Z59352 are fragments of the human STP2 gene. The
CC   fragments are from the 8 exons, the promoter region, 3' and 5'
CC   untranslated regions of the STP2 gene. Each sequence contains a newly
CC   identified STP2 gene single nucleotide polymorphism (SNP). STP2 is a
CC   phenol sulphotransferase. Substrates for STP2 include minoxidil,
CC   acetaminophen, and paranitrophenol. Several of the nucleotide changes
CC   identified at the polymorphism sites, give rise to an amino acid change.
CC   Amino acid changes may result in altered enzyme activity. The sequences
CC   can be used as probes for detecting STP2 polymorphisms. The polymorphic
CC   probes are used in screening and genotyping, i.e. to predict the rate of
CC   metabolism of STP2 substrates, potential drug-drug interactions and
CC   adverse side effects. They can also be used to detect diseases resulting
CC   from accidental or occupational exposure to toxins and to establish
CC   animal, cell or in vitro models for drug metabolism

PT   Nucleic acid molecules useful for identifying compounds affecting
PT   interactions between RNA molecules and identifying RNA binding proteins.
XX
PS   Example 1; Page 33; 58pp; English.
XX
CC   The invention relates to mRNA sequences which bind to RNA binding
CC   proteins, and their use for identifying RNA binding proteins and
CC   compounds which have an effect on the interactions between an RNA binding
CC   protein and an RNA molecule. The disclosed sequences are the 3'
CC   untranslated region (3' UTR) sequences APP-R1, APP-D3 and APP-I1 from the
CC   human amyloid precursor protein mRNA (AAA14456-A14458); the 3' UTR of
CC   human interleukin-10 (IL-10) mRNA (AAA14459); the 3' UTR of human erb-B2
CC   mRNA (AAA14460); and the 5' UTR of human insulin-like growth factor I
CC   receptor (IGF-IR) mRNA (AAA14461). The disclosed mRNA sequences may be
CC   used to identify compounds affecting interactions between an RNA molecule
CC   comprising the sequence and an RNA binding protein. Such compounds can
CC   then be included with a carrier in pharmaceutical compositions for
CC   altering expression of a gene comprising the sequences, which can be
CC   administered to individuals or cells requiring altered expression of the
CC   gene. The mRNA sequences are also useful to identify RNA binding proteins
CC   which interact with them. Compounds identified as having the ability to
CC   affect such RNA binding interactions may therefore be useful as drugs for
CC   modulating protein levels in disease states. The present sequence
CC   represents an AUUUA RNA sequence used as a target molecule in an
CC   exemplification of the invention in an assay for detecting interactions
CC   between RNA molecules and RNA binding proteins

PT improve crop quality or yields.
XX
PS Disclosure; Page 147; 181pp; English.
XX
CC The present sequence is a primer PAD4.5 which is used to sequence
CC Arabidopsis thaliana PAD4 and pad4-1 alleles and corresponds to positions
CC 8293-8273 of Arabidopsis genomic clone pAtgPAD4. PAD4 gene is located on
CC Arabidopsis chromosome 3 and encodes a protein which plays an important
CC role in disease resistance in plants. The protein has positive regulatory
CC effect on phytoalexin levels and PR-1 (pathogenesis-related protein)
CC expression levels, but has no effect on PR-5 (pathogenesis- related
CC protein), BGL2 (beta-glucanase) or ASA1 (anthranilate synthase)
CC expression levels in a disease defence response by a host plant. PAD4 is
CC required upstream from salicylic acid in the signal transduction pathway
CC leading from infection to activation of defence responses. It is used to
CC produce transgenic plants which have enhanced resistance to diseases
CC caused due to pathogens such as bacteria, fungi, and nematodes,
CC especially Phytophthora, Peronospora or Pseudomonas. Such transgenic
CC plants are useful agronomically e.g. to improve crop quality or yield

PT Multipotent retinal stem cell precursors, for treating retinal
PT degeneration, especially retinitis pigmentosa.
XX
PS Example 1; Page 21; 62pp; English.

```
XX
CC   The invention provides multipotent retinal stem cell precursors (A). (A)
CC   can be prepared by dissociating embryonic retinal explants to form a
CC   suspension of retinalspheres, plating these, and exposing them to a
CC   growth factor so that they remain proliferative and uncommited, then
CC   isolating (A). (A) are used: by transplantation, to treat or prevent
CC   disorders of the retina associated with inherited or age-related
CC   degeneration of photoreceptors (retinitis pigmentosa and macular
CC   degeneration); to screen for agents that promote survival or
CC   differentiation of (A), i.e. agents potentially useful for preventing
CC   death of photoreceptors; for studying differentiation mechanisms that
CC   lead to photoreceptors; possibly as a source of cell-survival factors,
CC   and in diagnosis. (A) can differentiate into photoreceptors; can be
CC   expanded in culture and remain viable for a long time. They represent an
CC   alternative to use of fetal tissue. Sequences AAZ46461-462 represent rat
CC   opsin gene specific PCR primers used for amplifying the opsin transcript

PT   New nucleic acids other than naturally occurring chromosomes encoding
PT   ASTH1 protein, for e.g. screening compositions that modulate expression
PT   or function of ASTH1 proteins or as diagnostics for genetic
PT   predisposition to asthma.
XX
PS   Example; Col 39-40; 131pp; English.
XX
CC   The invention relates to the ASTH1 locus on the short arm of human
CC   chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which
CC   are associated with a genetic predisposition to asthma and bronchial
CC   hyperreactivity. The ASTH1I and ASTH1J genes are oriented in opposite
CC   directions with the ASTH1 locus, and have similar patterns of expression
CC   and common sequence motifs. They are both expressed in trachea, lung and
CC   several other tissues. ASTH1I and ASTH1J are novel members of the ets
CC   family of transcription factors, which have been implicated in the
CC   activation of a variety of genes including the TCRa gene and cytokine
CC   genes known to be important in the aetiology of asthma. Both ASTH1I and
CC   ASTH1J mRNAs are alternatively spliced. Alternative splicing of
CC   transcripts has no effect on the open reading frame of ASTH1J, as the
CC   exons involved are all 5' to the start codon in exon b. In contrast,
CC   alternative splicing of ASTH1I transcripts results in 3 different ASTH1I
CC   isoforms. The invention also encompasses mouse asth1j protein. The ASTH1
CC   nucleic acids are useful as diagnostics to identify a hereditary
CC   predisposition to asthma, as probes for identifying ASTH1 related genes,
CC   for identifying expression of the gene in a biological specimen, and for
CC   generating genetically modified non-human animals or site specific gene
CC   modifications in cell lines. The encoded ASTH1 proteins are useful as
CC   immunogens to raise specific antibodies; in drug screening for
CC   compositions that mimic or modulate activity or expression of ASTH1I
CC   and/or ASTH1J (including altered forms of these proteins); and as a
CC   therapeutic. The ASTH1 genes or fragments thereof, encoded proteins,
CC   ASTH1 genomic regulatory regions, and anti-ASTH1I and anti-ASTH1J
CC   antibodies are useful in the identification of individuals predisposed to
CC   development of asthma, and for modulation of gene activity in vivo for
CC   prophylactic and therapeutic purposes. The intact ASTH1I or ASTH1J
CC   proteins or active fragments thereof may be used to modulate or reduce
CC   bronchial hyperreactivity. Sequences AAA80260-A80261 and AAA80264-A80416
CC   represent polymorphic sites within the ASTH1J or ASTH1I genes

CC   The present invention provides a method of diagnosing a vascular disease
CC   in an individual, involving determining the sequence at various
CC   polymorphic sites within the human thrombospondin 1 and thrombospondin 4
CC   genes. The sequences at a number of polymorphic sites are also provided
CC   in the specification. In particular, the method can be used in the
CC   diagnosis of atherosclerosis, myocardial infarction, coronary heart
CC   disease, stroke, peripheral vascular diseases, venous thromboembolism and
CC   pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
CC   useful in forensics, paternity testing, genetic analysis and phenotype
CC   correlations to diseases. The present sequence is an example of one of
CC   the human gene SNPS shown in the specification

PT   Cytokine C121 forming part of immune suppressor factor for development of
PT   remedies for cytokine-mediated disorders including cancer and infectious
PT   and autoimmune diseases.
XX
PS   Example 9; Page 55; 128pp; Japanese.
XX
CC   The invention relates to a novel mouse cytokine, C121 (AAB48976) and to
CC   cDNA encoding it (AAC92907). C121 corresponds to the C-terminus of mouse
CC   immune suppressor factor (ISF), but is a complete protein as the cDNA
CC   encoding it is full-length, rather than just being a 3' fragment of mouse
CC   ISF cDNA. The C121 cDNA was isolated from a mouse myeloid stroma cell
CC   line (ST2) cDNA library, using a retrovirus-based expression cloning
CC   method. The C121 protein can be present as a soluble or a membrane-bound
CC   protein, and both forms support the proliferation of S21 cells. The
CC   invention also discloses the cDNA and protein sequence of human ISF
CC   (AAC92908, AAB48977). Human ISF cDNA was isolated from a human kidney
CC   cDNA library using primers and probes based on the mouse ISF and C121
CC   sequences. The invention further relates to recombinant vectors and host
CC   cells comprising mouse C121 or human ISF nucleic acids, and the
CC   recombinant production of mouse C121 and human ISF. The invention also
CC   encompasses C121-specific antibodies, and methods of screening for agents
CC   which bind to C121 and C121 activity modulators. C121, and nucleic acids
CC   which encode it may be used in the diagnosis, treatment and prevention of
CC   diseases in which C121 expression is implicated, including cancer,
CC   infectious diseases, autoimmune diseases and thrombosis. The present
CC   sequence represents a PCR primer used in the isolation of human ISF cDNA
CC   in an exemplification of the invention

PT In vitro production of T cells, useful for treating immune disorders e.g.
PT AIDS, lymphoma and DiGeorge's Syndrome, involves culturing a lymph node
PT cell in vitro with a primate hematopoietic T cell progenitor cell.
XX
PS Example 6; Page 22; 41pp; English.
XX
CC This invention relates to a method for the in vitro production of T
CC cells. The T cells are generated from a population of haematopoietic T
CC cell progenitor cells. One example comprises culturing a lymph node cell
CC in vitro with a primate haematopoietic T-cell progenitor cell. The method
CC is useful for modifying a haematopoietic stem cell to produce a
CC descendent cell containing a nucleotide sequence of interest. This
CC comprises contacting the primate hematopoietic T cell progenitor cell and
CC the lymph node cells with an expression vector such as a viral vector,
CC comprising a nucleotide sequence of interest, so as to allow the virus to
CC enter the haematopoietic T cell progenitor cell. The method is also
CC useful for treating a subject having an immune disorder such as an
CC immunodeficiency or immunoproliferative disorder, further comprising
CC administering the progenitor cell or its descendent to the subject.
CC Factors such as cytokines are also administered to the lymph node in the
CC subject. The method is useful for treating immune disorders such as AIDS,
CC DiGeorge's Syndrome (Complete Athymia), and immunoproliferative disorders
CC such as lymphoma. Haematopoietic T cells produced by the method and their
CC progeny are used as carriers for the production of a wide variety of
CC products where the host cell is genetically deficient or as a result of
CC subsequent diseases as become genetically deficient. The present sequence
CC represents a PCR primer used to amplify cDNA in a pTalpha assay. The
CC assay is used to determine the presence or absence of immature T cells,
CC in an example illustrating the method of the invention

XX
CC The present invention relates to novel methods for constructing fungal
CC strains useful for identification and validation of gene products as
CC targets for therapeutic agents, for creating a collection of identified
CC essential genes, and screening assays for the discovery of new drugs. The
CC invention provides the GRACE (gene replacement and conditional
CC expression) method for the construction of mutant organisms referred to
CC as GRACE strains of the organism. The invention can be applied to any
CC organism, particularly a pathogenic fungus e.g. Candida albicans,
CC Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful
CC to identify agents that may be used in the treatment of fungal
CC infections. AAS23687-AAS23747 represent primers A #1-61 used as probes
CC for identifying C. albicans GRACE strains

PT Detecting bovine complex vertebral malformation in a subject, involves
PT detecting presence or absence of a genetic marker linked to a bovine
PT complex vertebral malformation disease trait in a bovine genetic
PT material.
XX
PS Claim 29; Page 15; 47pp; English.
XX
CC The presents invention relates to a new method of detecting bovine
CC complex vertebral malformation (CVM) in a bovine subject, where the
CC presence of a genetic marker associated with bovine CVM is identified.
CC The method of the invention involves providing a bovine genetic material,
CC and detecting in the genetic material, the presence or absence of at
CC least one genetic marker that is linked to a bovine CVM disease trait.
CC The method is useful for detecting bovine CVM in a bovine subject and is
CC also useful for detecting the presence of the genetic marker associated
CC with bovine CVM in a bovine subject. The present nucleic acid sequence
CC represents a PCR primer that was used in the method of the invention for
CC genetic mapping of bovine CVM

PT New human stem cell composition, useful for treating various cancers,
PT e.g. ovarian cancer, melanoma, testicular cancer, lung cancer or brain
PT cancer, as well as for other non-malignant hematopoietic diseases, e.g.
PT thrombocytopenia.
XX
PS Claim 5; Page 47; 59pp; English.
XX
CC The present invention relates to transforming growth factor (TGF)-beta
CC blocking agent-treated human stem cell compositions which are capable of
CC rapid in vivo reconstitution of the haematopoietic system of a subject.
CC The composition comprises a cell population enriched for human stem
CC cells, the stem cells treated ex vivo with an oligomer antisense to TGF-
CC beta, where the viability and differentiation state of the stem cells is
CC preserved in culture longer than stem cells not subjected to TGF-beta
CC antisense treatment. The human stem cell composition is useful for
CC promoting the rapid engraftment of long term repopulating haematopoietic
CC stem cells (LTR-HSC) following in vivo administration and facilitate the
CC rapid proliferation of LTR-HSC in vitro. The HSC- containing cell
CC population is useful for treating various cancers, including ovarian
CC cancer, thymomas, germ cell tumours, multiple myeloma, melanoma,
CC testicular cancer, lung cancer and brain cancer as well as for other non-
CC malignant haematopoietic diseases, e.g. thrombocytopaenia. Sequences of
CC the invention are also used in gene therapy. The present sequence is TGF-
CC beta type II receptor antisense oligonucleotide

PT Novel isolated Fanconi anemia protein complex polypeptide, termed FANCD2,
PT useful for treating Fanconi anemia pathway defect in cell target or for
PT treating patient with defective FANCD2 gene.
XX
PS Claim 8; Page 55; 103pp; English.
XX
CC The invention relates to an isolated Fanconi anaemia protein complex
CC (FANCD2) polypeptide. The FANCD2 protein comprises a sequence of 1472
CC amino acids fully defined in the specification, its 90% identical
CC sequence, a sequence encoded by a polynucleotide that is at least 90%
CC identical to sequences given in specification such as a 5127 base pair
CC sequence, or a fragment which is at least 50 amino acids in length. The
CC FANCD2 protein is useful for treating an FA pathway defect in a cell
CC target or for treating a patient with a defective FANCD2 gene. The FANCD2
CC gene is useful for making a recombinant expression vector. The FANCD2
CC protein and its gene are useful as a novel target for therapeutic
CC development, and in diagnostic test and screening assays for diseases
CC associated with DNA repair and cell cycle abnormalities such as Fanconi
CC anaemia, Bloom's syndrome, Cockayne's syndrome, Hereditary non-polyposis
CC colon cancer, ataxia telangiectasia and Xeroderma pigmentosum. The FANCD2
CC gene is useful in producing probes and primers for screening patients in
CC genetic based test, for diagnosing Fanconi anaemia and cancer, for
CC preparing an experimental mouse model for use in screening new
CC therapeutics for treating conditions involving defective DNA repair, and
CC in gene therapy methods. A recombinant vector containing the FANCD2 gene
CC of the invention is useful in gene therapy. This polynucleotide sequence
CC represents a PCR primer for amplifying a FANCD exon relating to the
CC invention

PT New alpha catenin polypeptides and polynucleotides encoding them, useful
PT for predicting, diagnosing or treating cadherin-catenin related diseases,
PT particularly cardiomyopathies, cancer and male infertility.
XX
PS Example; Page 35; 132pp; English.
XX
CC The invention relates to human and mouse alpha-catenin polypeptides and
CC their associated polynucleotides. The polypeptides and related antibodies
CC are useful for modulating the cadherin-catenin related pathway in
CC selected organs, such as the heart and testis. The nucleic acids and the
CC antibodies are useful in the diagnosis and/or prediction of the
CC likelihood of developing cadherin-catenin related diseases. The nucleic
CC acids may also be used to predict the likelihood of developing cancer or
CC in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic
CC acid or the antibody is useful in manufacturing a medicament for treating
CC cadherin-catenin related diseases, such as cancer, cardiomyopathy,
CC specifically dilated cardiomyopathy, and male infertility. Sequences
CC ABK41510-ABK41599 represent PCR primers used to amplify DNA encoding
CC human and mouse alpha-catenin polypeptides, including the CTNNA3 gene
CC which encodes human alpha T-catenin

PT Novel thermostable DNA polymerase I obtainable from Rhodothermus
PT obamensis, useful for improving the fidelity of DNA amplification
PT reactions, has 3'-5' exonuclease activity and a specified half life.
XX
PS Example 1; Col 5; 25pp; English.
XX
CC The invention relates to a substantially pure thermostable DNA polymerase
CC I obtainable from Rhodothermus obamensis (JCM 9785), and having a
CC molecular weight of 104 kDa, possessing 3'-5' exonuclease activity and
CC having a half-life of 35 minutes at 94 plusoC. Also included are (1) a
CC recombinant R. obamensis DNA polymerase I large fragment, having a
CC molecular weight of about 71 kDa, possessing 3'-5' exonuclease activity
CC and having a half-life of about 35 minutes at 94 plusoC and (2) a DNA
CC polymerase I composition comprising R. obamensis DNA polymerase I large
CC fragment and an approximately 60 kDa Escherichia coli GroEL protein,
CC where the thermostability of R. obamensis DNA polymerase I large fragment
CC is increased by the presence of GroEL protein. The thermostable DNA
CC polymerase is useful for improving the fidelity of DNA amplification
CC reactions. The present sequence is a PCR primer used to isolate DNA
CC encoding R. obamensis DNA polymerase I. (Updated on 29-AUG-2003 to
CC standardise OS field)

XX
PT Constructing strains for identifying gene products as effective targets
PT for therapeutic intervention, by inactivating in the strain one allele of
PT a gene and placing other allele of the gene under conditional expression.
XX
PS Claim 36; SEQ ID NO 4086; 167pp + Sequence Listing; English.
XX
CC The invention relates to constructing (M1) a strain of diploid fungal
CC cells in which both alleles of a gene are modified, comprising modifying
CC one allele by insertion or replacement by a cassette having an
CC expressible selectable marker and modifying other allele by
CC recombination, of a promoter replacement fragment with a heterologous
CC promoter, so that expression of the second allele is regulated by the
CC promoter. (M1) is useful for constructing a strain of diploid fungal
CC cells in which both alleles of a gene are modified. The diploid fungal
CC cells having both alleles modified are useful for identifying a gene that
CC is essential to the survival or growth of a fungus, a gene that
CC contributes to the virulence and/or pathogenicity of a fungus, a gene
CC that contributes to the resistance of a diploid fungus to an antifungal
CC agent, an antifungal agent that inhibits the growth of a diploid fungus
CC and for identifying a therapeutic agent for treatment of a mammalian
CC disease. (M1) is useful for identifying a compound which modulates the
CC activity of a gene product, preferably enzymatic activity, carbon
CC compound catabolism, biosynthetic, transporter, transcriptional,
CC translational, signal transduction, DNA replication and cell division
CC activity. The method is useful for identifying a compound having the
CC ability to inhibit growth or proliferation of C. albicans cells and for
CC treating infection by C. albicans. The present sequence is that of a PCR
CC primer used in the method of the invention. Note: The sequence data for
CC this patent is not represented in the printed specification but is based
CC on sequence information supplied to Derwent by the European Patent Office

PT Isolated nucleic acid molecules having polymorphisms in known human genes
PT e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT for locating, identifying and characterizing the genes responsible for
PT disorder-related traits.
XX
PS Example 24; Page 152; 714pp; English.
XX
CC This invention relates to the sequence of an isolated nucleic acid
CC molecule comprising at least one base variation from that of a known
CC human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC The polymorphisms in the human genes cited in the invention are useful as
CC genetic linkage markers for locating and characterising the genes that
CC are responsible for specific traits within the genome and eventually
CC identifying the genes responsible for a variety of disorder-related
CC traits as a result of their e.g., overexpression, constitutive
CC expression, mutation or underexpression, which may be used in diagnosing
CC and/or treating the disorders. The nucleic acid molecules comprising the
CC polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC used to screen for altered cardiovascular function, in COX2 for altered
CC susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC nervous system function, in FLAP and HNMT for altered pulmonary,
CC immunological or haematological function, in KLK2 for altered serine
CC protease activity in the prostate, in LTF for altered immunological or
CC haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC peripheral nervous system function. The present sequence represents a
CC polymorphic DNA sequence of the invention

CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC The polymorphisms in the human genes cited in the invention are useful as
CC genetic linkage markers for locating and characterising the genes that
CC are responsible for specific traits within the genome and eventually
CC identifying the genes responsible for a variety of disorder-related
CC traits as a result of their e.g., overexpression, constitutive
CC expression, mutation or underexpression, which may be used in diagnosing
CC and/or treating the disorders. The nucleic acid molecules comprising the
CC polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC used to screen for altered cardiovascular function, in COX2 for altered

```
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   polymorphic DNA sequence of the invention

PT   Genetically modified human microglia cell for treating neurodegenerative
PT   disease, comprises demonstrable phagocytic properties, produces progeny
PT   in culture, presents surface antigens, and contains modified human
PT   genomic DNA.
XX
PS   Example; Page 23; 46pp; English.
XX
CC   The invention relates to a genetically modified human microglia cell
CC   maintained stably in vitro which has (i) has demonstrable phagocytic
CC   properties; (ii) produces progeny continuously in culture; (iii) presents
CC   CD11b and CD68 as surface antigens; and (iv) contains human genomic DNA
CC   that has been genetically modified to include a viral vector carrying at
CC   least one DNA segment encoding an exogenous gene for intracellular
CC   expression. The microglia cell line is useful for screening compounds for
CC   the treatment of autoimmune disease, and is used in the treatment of a
CC   neurodegenerative disorder e.g. Alzheimer's disease, Parkinson's disease,
CC   Huntington's disease, amyotrophic lateral sclerosis, stroke, spinal cord
CC   injuries, ataxia, brain trauma, multiple sclerosis and AIDS-(acquired
CC   immunodeficiency syndrome)-dementia. The cell line is also useful for
CC   isolating neurotoxic or neurotrophic molecules naturally produced by
CC   human microglia. The present sequence is an RT-PCR (reverse transcriptase
CC   PCR) primer which amplifies a segment of the mRNA for an expressed marker
CC   gene, used to characterise the cell line

PT   New isolated cytoplasmic, nuclear, membrane bound, or secreted
PT   polypeptide, useful for treating cardiomyopathy, atherosclerosis,
PT   infections, cancer, neurodegenerative, metabolic, hematopoietic and
PT   immune disorders.
XX
PS   Example 7; Page 173; 213pp; English.
XX
CC   The invention relates to an isolated cytoplasmic, nuclear, membrane
CC   bound, or secreted polypeptide (NOVX, x= 1-14) their variants or mature
CC   form. Also included are the nucleic acids encoding the NOVX proteins, a
CC   vector comprising the nucleic acid, a cell comprising the vector, an anti
CC   -NOVX antibody and modulators of NOVX. NOVX, the nucleic acid and the
CC   antibody are useful for treating or preventing a NOVX-associated
CC   disorder, where the disorder is selected from cardiomyopathy,
CC   atherosclerosis, diabetes, a disorder related to cell signal processing
CC   and metabolic pathway modulation, metabolic disorders, obesity,
CC   infectious disease, anorexia, cancer-associated cachexia, cancer,
CC   neurodegenerative disorders, Alzheimer's disease, Parkinson's disease,
CC   immune disorders, haematopoietic disorders, and the various
CC   dyslipidaemias, metabolic disturbances associated with obesity, the
CC   metabolic syndrome X and wasting disorders associated with chronic
CC   diseases, bacterial, fungal, protozoal and viral infections, pain,
CC   bulimia, asthma, hypertension, urinary retention, osteoporosis, Crohn's
CC   disease, multiple sclerosis, Albright Hereditary Osteodystrophy, angina
CC   pectoris, myocardial infarction, ulcer, allergy, benign prostatic
CC   hypertrophy, and psychotic and neurological disorders, including anxiety,
CC   schizophrenia, manic depression, delirium, dementia, and dyskinesias,
CC   such as Huntington's disease and Gilles de la Tourette's syndrome. The
CC   nucleic acid is useful in gene therapy. The present sequence is an RT-PCR
CC   (reverse transcriptase PCR) primer used to quantitate tissue specific
CC   expression of a NOVX transcript

PT   Substantially pure polypeptides having e.g., 1-deoxyxylulose-5-phosphate
PT   synthase activity, useful for the production of isoprenoids, especially
PT   CoQ(10).
XX
PS   Example 4; Page 64; 246pp; English.
XX
CC   The invention relates to methods and materials for the production of
CC   isoprenoids. More particularly the invention provides isolated nucleic
CC   acids, substantially pure polypeptides, host cells, and methods for
CC   producing various isoprenoid compounds. The polypeptides are useful for
CC   the production of isoprenoids, especially CoQ(10). Expressing the pure
CC   polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DXS)
CC   activity or decaprenyl diphosphate synthase (DDS) activity, is useful for
CC   increasing production of CoQ(10) in a cell having endogenous DDS
CC   activity. This polynucleotide sequence represents a PCR primer relating
CC   to the isoprenoid production of the invention

PT   Novel polynucleotide of the endothelin/endothelin converting
PT   enzyme/receptors of endothelin and endothelin converting enzyme signaling
PT   system associated with cardiovascular disease, useful for treating the
PT   disease.
XX
PS   Example 6; Page 67; 190pp; English.
XX
CC   The invention describes a polynucleotide (I) of the endothelin
CC   (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR)
CC   signaling system which is associated with a cardiovascular disease. (I),
CC   the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I)
CC   or (II) is useful for producing cells capable of expressing a molecular
CC   variant polypeptide which is associated with a cardiovascular disease.
CC   (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a
CC   molecular variant gene comprising (I) is useful for identifying and
CC   obtaining a pro-drug or drug capable of modulating the activity of a
CC   molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system
CC   or its gene product, or for identifying and obtaining an inhibitor of the
CC   activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE
CC   signaling system or its gene product. The isolated proteins and
CC   polynucleotides encoding them are useful for preparation of a
CC   pharmaceutical composition for treating a cardiovascular disease such as
CC   coronary heart disease, hypertension, atherosclerosis, or related to
CC   abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial
CC   hypercholesterolaemia. The gene or a polynucleotide fragment of the
CC   EDN/ECE/EDNR signaling system are useful as forensic markers, for
CC   creating a transgenic animal and in creation of a solid support
CC   comprising polynucleotides, genes, vectors, polypeptides, antibodies or
CC   host cells of the invention. This sequence represents a PCR primer used
CC   to identify single nucleotide polymorphisms in DNA encoding
CC   cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway

PT   Modulating Adenylate-Uridylate Rich element-mRNA regulation involves
PT   administering new amide compound that inhibits secretion of protein
PT   encoded by ARE-mRNA, useful for treating inflammation, arthritis and
PT   autoimmune diseases.
XX
PS   Disclosure; Fig 5; 147pp; English.
XX
CC   The present invention relates to a method of modulating the regulation of
CC   an adenylate-uridylate rich element (ARE)-mRNA, which involves
CC   administering new compounds that inhibits secretion of a protein encoded
CC   by an ARE-mRNA. This can be used in the treatment of inflammation,
CC   arthritis, autoimmune diseases, septic shock, blood clot, stroke, fever,
CC   acute respiratory distress syndrome (ARDS) and cachexia. The present
CC   sequence is an ARE-mRNA shown in the exemplification of the invention

PT   Polymerase chain reaction amplification for mutagenesis, by incubating
PT   reaction mixture having template, primers, archaeal exo-DNA polymerase
PT   and amplification enhancing factor to produce mutated amplified product.
XX
PS   Example 3; Page 37; 57pp; English.
XX
CC   The invention relates to polymerase chain reaction (PCR) amplification
CC   for mutagenesis. The method involves incubating a reaction mixture
CC   comprising a nucleic acid template, at least two PCR primers, an archaeal
CC   exo-DNA polymerase, and PCR enhancing factor under conditions which
CC   permit amplification of the nucleic acid template by the archaeal exo-DNA
CC   polymerase to produce a mutated amplified product. The method is useful
CC   for performing PCR mutagenesis. The method is useful for making nucleic
CC   acid mutant libraries, and as control for the mutazyme error prone PCR.
CC   The method is simple for controlling mutation frequencies of target
CC   nucleic acid template, allows the amplification of highly complex
CC   targets, and provides higher product yields. The present sequence
CC   represents a PCR primer for amplifying a 720 bp gene encoding a humanised
CC   R. reinformis green fluorescent protein (GFP), used as mutational target
CC   for Mutazyme PCR mutagenesis

PT Identifying a test compound that binds to a target RNA molecule for
PT treating or preventing amyloidosis, hemophilia, cancer, gigantism,
PT diabetes, by contacting a detectably labeled target RNA molecule with a
PT library of test compounds.
XX
PS Example; Page 18; 152pp; English.
XX
CC The invention relates to a method for identifying a test compound that
CC binds to a target RNA molecule, which comprises contacting a detectably
CC labelled target RNA molecule with a library of test compounds under
CC conditions that permit direct binding of the labelled target RNA to a
CC member of the library of test compounds so that a detectably labeled
CC target RNA:test compound complex is formed. The method is useful for
CC screening libraries of compounds for those that are selectively bind to a
CC pre-selected target RNA. The compounds are useful for inhibiting the
CC formation of a specific bound RNA:host cell factor complexes in vivo.
CC They are also useful for treating or preventing diseases associated with
CC overproduction or decreased protein function, such as amyloidosis,
CC haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism,
CC dwarfism, hypothyroidism, hyperthyroidism, autoimmune disorders, aging,
CC inflammation, cystic fibrosis, diabetes, obesity, neurodegenerative
CC disorders, Parkinson's disease or infections (bacterial, viral, fungal).
CC The invention is also used in gene therapy. The present sequence is human
CC adenylate uridylate-rich element (ARE) motif mRNA. This sequence is used
CC to illustrate the method of the invention

PT e.g. osteoporosis.
XX
PS Disclosure; Page 53; 127pp; English.
XX
CC The present sequence is that of a Group I Cluster AU rich element (ARE).

CC AREs play a role in mRNA stability. The invention provides methods of
CC altering the level of ARE-containing RNA, e.g. an RNA containing the
CC present motif. The human exosome has been purified and characterised. It
CC promotes the degradation of ARE-containing RNAs. A claimed method for
CC altering the level of an ARE-containing RNA involves contacting the RNA
CC with an ARE-binding protein, a mammalian (human) exosome and an agent
CC that alters the level of binding of the exosome to the ARE-binding
CC protein. Levels of mRNA are decreased or increased by impacting the level
CC of degradation of the mRNA. Reducing the level of a cytokine, proto-
CC oncogene or growth factor RNA can be used to treat an immune disease,
CC inflammatory disease or cancer. Increasing the level of a target RNA can
CC be performed in a subject capable of developing a hormone deficiency

PT Diagnosing or determining cancer or increased risk of cancer in a
PT patient, by testing Fanconi Anemia/BRCA pathway gene or protein for a
PT cancer-associated defect, that indicates cancer or increased risk of
PT cancer.
XX
PS Claim 11; SEQ ID NO 139; 160pp; English.
XX
CC The invention relates to a novel method of diagnosing or determining if a
CC patient has cancer or is at increased risk of cancer, involving testing a
CC Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a
CC cancer-associated defect, where the presence of one or more cancer-
CC associated defects is indicative of cancer or an increased risk of cancer
CC in the patient. The method of the invention has cytostatic activity. The
CC method is useful for determining if a patient has cancer, or is at
CC increased risk of developing cancer, e.g. breast, ovarian or prostate
CC cancer. A microarray of the invention is useful for determining if a
CC patient has cancer, or is at increased risk of developing cancer, by
CC hybridising a nucleic acid sample to the nucleic acid sequences from the
CC array, and detecting the presence of mutations in FA/BRCA pathway genes
CC in the nucleic acid sample from the patient, where detecting the presence
CC of mutations is indicative of a patient who has cancer, or is at
CC increased risk of developing cancer. A method of the invention is useful
CC for screening a chemosensitising agent, and the agent obtained is useful
CC for treating a patient having a cancer. The present sequence is used in
CC the exemplification of the invention.

PT New polynucleotides and polypeptides for predicting the activity of
PT compounds that interact with protein tyrosine kinases and/or protein
PT tyrosine kinase pathways.
XX
PS Example 2; SEQ ID NO 555; 139pp; English.
XX
CC The present invention describes a predictor set comprising a plurality of
CC polynucleotides or polypeptides whose expression pattern is predictive of
CC the response of cells to treatment with a compound that modulates protein
CC tyrosine kinase activity or members of the protein tyrosine kinase
CC pathway. Also described: (1) predicting whether a compound is capable of
CC modulating the activity of cells, comprising obtaining a sample of cells,
CC determining whether the cells express a plurality of markers, and
CC correlating the expression of the markers to the compound's ability to
CC modulate the activity of the cells; (2) a plurality of cell lines for
CC identifying polynucleotides and polypeptides whose expression levels
CC correlate with compound sensitivity or resistance of cells associated
CC with a disease state; and (3) identifying polynucleotides and
CC polypeptides that predict compound sensitivity or resistance of cells
CC associated with a disease state, comprising subjecting the plurality of
CC cell lines to one or more compounds, analysing the expression pattern of
CC a microarray of polynucleotides or polypeptides, and selecting

```
CC   polynucleotides or polypeptides that predict the sensitivity or
CC   resistance of cells associated with a disease state by using the
CC   expression pattern of the microarray. The polynucleotides and
CC   polypeptides have cytostatic activities, and can be used in gene therapy.
CC   The polynucleotides and polypeptides are useful in predicting the
CC   activity of compounds that interact with protein tyrosine kinases and/or
CC   protein tyrosine kinase pathways. These may be used in determining drug
CC   sensitivity in patients to allow the development of individualized
CC   genetic profiles which aid in treating diseases and disorders (e.g.
CC   cancer) based on patient response at a molecular level. The present
CC   sequence is used in the exemplification of the present invention.

PT   Identifying an agent having inhibitory effects on the complex-formation
PT   of ARE-containing mRNA and HuR protein, useful for treating disorders
PT   with aberrant production of a cytokine, growth factor, proto-oncogene or
PT   a viral protein.
XX
PS   Example 5; Page 20; 32pp; English.
XX
CC   The present sequence is that of an AU-rich element (ARE) motif. A 2-
CC   dimensional FIDA anisotropy analysis was performed to determine the
CC   affinity of human Hu-antigen R (HuR) for this, and other, AREs. Kd values
CC   of soluble and non-soluble forms of full-length HuR ADE85987 for the ARE
CC   were 0.4 +/- 0.05 and 23.47 +/- 8.92 nM, respectively. The RNA sequence
CC   motif NNUUNNUUU was identified as the binding site for HuR. The complex
CC   formation of an ARE-containing mRNA with an HuR protein induces the
CC   expression of various disease causing/mediating substances, such as
CC   inflammatory acting substances, e.g. cytokines, growth factors, proto-
CC   oncogenes and viral proteins. Agents which inhibit complex formation may
CC   thus prevent the expression of such substances and may be used in the
CC   treatment of e.g. inflammatory diseases. The invention provides an assay
CC   for identifying compounds with an inhibitory effect on selected HuR-ARE
CC   target interactions. A pharmaceutical composition comprising an agent
CC   identified by the assay can be used to treat a disorder having an
CC   aetiology associated with the production of a cytokine, growth factor
CC   proto-oncogene or a viral protein.

PT   Identifying, isolating and regulating senescence-related genes - useful
PT   to ameliorate problems associated with accumulation of senescent cells,
PT   e.g. age-related lipofuscin accumulation in the retina and AIDS.
XX
PS   Claim 6; Page 25; 135pp; English.
XX
CC   AAT28044-T28075 represent primers for human fibroblasts in enhanced
CC   differential display (EDD), which is used in conjuncture with the method
CC   of the invention. EDD is an mRNA preparation method. AAT28044-T28055
CC   represent T-rich 3'-primers, while AAT28056-T28075 are randomly selected
CC   5'-primers used in EDD of human fibroblasts. The 3'-primers used are
CC   complementary to the poly-A tail of the mRNA. In the method of the
CC   invention, mRNA is isolated from a senescent cell, and a young quiescent
CC   cell, and the mRNAs are amplified in separate reaction mixtures. The
CC   amplified sequences are then separated by size or charge, and the
CC   products are analysed to identify a gene from young quiescent cells and
CC   dividing cells, that is present at a different level from senescent
CC   cells. The method can be used for the rapid and efficient identification
CC   and isolation of senescence-related genes and gene products, and to
CC   detect and distinguish between senescent and non-senescent cells. It can
CC   also be used to destroy cells expressing senescence specific (or related)
CC   gene products, and to screen for compounds capable of altering gene
CC   expression in senescent cells. The method can also be used to ameliorate
CC   problems associated with the accumulation of senescent cells such as age-
CC   related lipofuscin accumulation in the retina, and in the treatment of
CC   AIDS. Also, the method can be used to distinguish young cells from
CC   senescent cells in donor tissue, which is useful in removing senescent
CC   melanocytes overexpressing melanin which cause hypopigmentation, or liver
CC   spots

PT   polymerase chain reaction amplification method.
XX
PS   Claim 9; Col 17; 15pp; English.
XX
CC   An improved method of Differential Display, named Enhanced Differential
CC   Display (EDD) has been designed as a technique for screening differences
CC   in gene expression between various cell types or between different stages
CC   of cell development. The technique is highly reproducible, leading to
CC   precise typing of the expressed genes in any given cell. EDD analysis
CC   permits the identification of novel genes involved in differentiation,
CC   aging and disease, and enables direct comparisons of different cell types
CC   and disease states. By using longer primers, and/or an alteration in the
CC   annealing temperatures, the number of false positives can be reduced.
CC   First, cDNA is prepared from total cellular RNA using 12 different 22-
CC   base oligonucleotides (AAT58484-95) that are targeted to the poly A tail
CC   of pol II mRNA transcripts. The last two bases of each primer varies so
CC   as to anchor the primer to the 3' end of different sets of mRNAs. A
CC   second set of 12 22-base oligo primers (AAT58472-83) is designed to
CC   randomly select a subset of cDNAs from each of the twelve 3' primers. PCR
CC   amplification of a subset of cDNAs is carried out in a two step process
CC   using particular 5' and 3' primers. The amplified gene products can then
CC   be directly sequenced or rapidly subcloned for DNA sequencing

PT   New isolated Aspergillus oryzae signaling sequences, used to increase the
PT   production of polypeptides by recombinant host filamentous fungal cells.
XX
PS   Example 2; Page 35; 78pp; English.
XX
CC   Sequences AAZ47342-Z47353 are oligo(dT12N2) primers used in the
CC   differential display analysis of the Aspergillus oryzae strains HC4.01
CC   and 27. The strains were analysed to find the genetic basis for phenotype
CC   differences in the strains which are used in a method for producing a
CC   polypeptide in an enhanced amount. The method involves cultivating a
CC   mutant of a parent filamentous fungal cell in suitable nutrient medium.
CC   The mutant cell contains the nucleotide sequence encoding the polypeptide
CC   to be synthesised and one or more second nucleotide sequences encoding a
CC   DDC polypeptide (see AAZ47338-Z47339). The mutant cell produces more of
CC   the polypeptide than the parent cell and the polypeptide can be recovered
CC   from the nutrient medium of the mutant cell. The method can be used for
CC   the production of polypeptides such as hormones, receptors, antibodies,
CC   reporters or enzymes, e.g. an aminopeptidase, amylase, carbohydrase,
CC   carboxypeptidase, catalase, cellulase, chitinase, cutinase, cyclodextrin
CC   glycosyltransferase, deoxyribonuclease, esterase, alpha-galactosidase,

PT   New conjugate for delivery to the cell nucleus, useful for treating
PT   infection by human immune deficiency virus, comprises targeting peptides
PT   and peptide nucleic acid.
XX
PS   Disclosure; Page 8; 30pp; German.
XX
CC   This invention describes a novel conjugate for mediating specific
CC   transport to the cell nucleus of a peptide nucleic acid (PNA) that
CC   hybridizes to an HIV (human immune deficiency virus) gene, or part of it.
CC   The conjugate comprises a transport mediator for the cell membrane, an
CC   addressing protein or peptide for nuclear importation and the PNA being
CC   delivered. The transport mediator is a peptide or protein able to pass
CC   through the plasma membrane, particularly derived from the penetratin
CC   family protein. The PNA is designed to hybridize to at least part of the
CC   tat or rev genes and is especially targeted to the long terminal repeat
CC   or the polypurine tract, the central DNA flap, Nef, NCp7 or the gag slice
CC   site, at the RNA level. The conjugate has the structure transport
CC   mediator-addressing protein-PNA, particularly with a spacer (e.g.
CC   polylysine or a synthetic polymer) between addressing protein and PNA.
CC   The conjugate of the invention has anti-HIV activity. The transport
CC   mediator/addressing protein combination provide rapid and efficient
CC   transport of PNA to the nucleus and PNA is resistant to proteases and
CC   nucleases. The conjugate can be used in both early and late stages of
CC   infection. This sequence represents a fragment of HIV-1 LTR region used
CC   to construct PNA's used in the method of the invention.

PS   Example 2; Page 16 (Disclosure); 32pp; Chinese.
XX
CC   The invention relates to pax protein 11 (AAM49189) and to nucleic acids
CC   encoding it (ABL55229). The protein has a molecular weight of 11 kD. The
CC   invention also relates to a method for the recombinant production of the
CC   protein, an antagonist of the protein, and the use of the protein, gene
CC   and antagonist in therapeutic applications. Pax protein 11 can be used in
CC   the treatment of a variety of diseases such as malignant tumours, blood
CC   diseases, HIV (human immunodeficiency virus) infection, immune disorders
CC   and inflammatory conditions. Sequences ABL55230-ABL55231 represent
CC   reverse transcription-PCR (RT-PCR) primers used in an exemplification of
CC   the invention to isolate human pax protein 11 cDNA

PT   New DNA binding protein 10.45 polypeptide for treating malignant tumors,
PT   hemopathy, inflammations, immunological diseases, and human
PT   immunodeficiency virus infection.
XX
PS   Example 2; Page 16 (disclosure); 32pp; Chinese.
XX
CC   The present invention discloses a new kind of polypeptide, RCCI protein
CC   10.45, a polynucleotide encoding the polypeptide and a DNA recombination
CC   process to produce this polypeptide. The present invention also discloses
CC   applying the polypeptide to treat various diseases, such as malignant
CC   tumours, haemopathy, inflammations, immunological diseases, and human
CC   immunodeficiency virus (HIV) infection. The present invention also
CC   discloses an antagonist resisting the polypeptide and its treatment
CC   effect. The present invention also discloses application of the
CC   polynucleotide encoding the new RCCI protein 10.45. The current sequence
CC   represents a DNA binding RCCI protein 10.45 related PCR primer

PT   Identifying extendible primers for use in identification, or
PT   classification of a nucleic acid of an organism, allele or gene such as
PT   class 1/2 HLA comprises identifying all possible nucleotide sequences of
PT   specific length.
XX
PS   Claim 14; Page 43; 66pp; English.
XX
CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PT   Nucleoside derivatives comprising pyrene, anthracene or phenanthrene
PT   joined to C-1 atom of ribose or de:oxy:ribose sugar moiety - useful in
PT   preparation of fluorescently-labeled DNA.
XX
PS   Example 5; Fig 13; 114pp; English.
XX
CC   The present sequence represents an unlabeled oligonucleotide. The
CC   invention relates to a new nucleoside derivative comprising a pyrene,
CC   anthracene or phenanthrene joined to the C-1 atom of a sugar moiety
CC   through a carbon-carbon bond in either an alpha or a beta configuration,
CC   where the sugar moiety is ribose or deoxyribose. Also claimed is a
CC   phosphoramidite derivative of the above nucleoside derivative. The above
CC   nucleotide derivatives are useful in preparation of fluorescently-
CC   labeled DNA or RNA. These may be used in detection of target nucleic
CC   acids through hybridisation. The nucleoside analogues stack neatly into
CC   an RNA or DNA helix and do not interfere with binding properties of
CC   surrounding complementary bases

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 131; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a genomic library of bovine MboI DNA fragments of between 250
CC   and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of
CC   50 clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
```

```
CC  used to identify individuals, for parentage testing, and in the genetic
CC  mapping of economic trait loci, or genes involved the determinism of
CC  economically important traits esp. in cattle, to allow selective
CC  breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT   DNA encoding mammalian growth response protein CGR11 or CGR19 - useful to
PT   suppress or diagnose cancer, also similar use of SM20 or mEH protein.
XX
PS   Example 2; Page 16; 46pp; English.
XX
CC   This oligo-dT primer was used with a random 10-mer primer (see AAT99553)
CC   in an RT-PCR amplification of rat embryo fibroblast REF-112 cell RNA.
CC   This was performed in order to identifying p53 regulated genes. One
CC   transcript that was upregulated specifically in cells harboring wild-type
CC   p53 protein was characterised. A previously known gene, mEH (microsomal
CC   epoxide hydrolase), was identified. 2 Novel cell growth regulatory genes,
CC   CGR11 (see AAV04008) and CGR19 (see AAV04010), were also isolated. These
CC   genes and the novel CGR11 and CGR19 growth regulatory proteins (see
CC   AAW38423 and AAW38425) can be used in methods for the diagnosis and
CC   treatment of cancer

XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PS   Disclosure; Col 15-16; 168pp; English.
XX
CC   The present sequence represents a polynucleotide that is able to form a
CC   triple helix with a double stranded sequence. Cytosine bases in the
CC   present can be replaced with 5-methylcytosine for increased triplex
CC   stability. The present sequence is used in the assay of the invention,
CC   where it can be part of the anchor DNA or reporter DNA sequence. The
CC   assay comprises adding a sample containing double-stranded DNA test
CC   sequences to an aqueous medium containing at least one complex of anchor
CC   DNA, attached to a solid support, and reporter DNA, where either a part
CC   of the anchor DNA or reporter DNA is designed to form a triple-strand
CC   structure with part of the test sequence. Triplex formation results in
CC   displacement of the reporter DNA which is detected as an indication of
CC   the presence of the DNA test sequence. The method is used to detect DNA
CC   sequences, particularly for identification of bacteria (by detecting
CC   genes for ribosomal RNA) in clinical samples, but also detection of
CC   oncogenes and Hepatitis B virus

PT Newly isolated nucleic acid molecule (designated p23) encoding a p23
PT polypeptide - useful for inducing a senescence phenotype in a cell.
XX
PS Example 1; Page 18; 44pp; English.
XX
CC The present invention describes human senescence factor p23. An
CC expression vector for p23 is useful for inducing a senescent phenotype in
CC a cell (preferably eukaryotic). This may help in regulating diseases,
CC including cancer, persistent inflammation, and various proliferative and
CC degenerative disorders. These transgenic cells are useful in gene therapy
CC for treating cancer, particularly where antisense oligonucleotides are
CC useful for blocking normal or mutant p23 expression in cancer cells or
CC other proliferating cells. Transgenic cells are also useful for producing
CC the p23 polypeptide in large quantities. The antibodies are useful for
CC raising antiserum against p23, and for identifying senescent cells in
CC culture and tissue biopsies. The p23 polynucleotides are useful for
CC modulating or altering p23 activity in a cell, and for identifying and
CC isolating the whole gene encoding p23, and variants of p23. Assays based
CC on p23 elements, which detect p23 levels and activity are useful as
CC diagnostic markers for staging tumours, determining prognosis, and/or
CC predicting therapeutic success. These elements also provide an assay for
CC detecting chromosomal rearrangements in chromosome 3 in a human cell. The
CC isolation of the p23 polynucleotide permits the manipulation of malignant
CC growth in cancer. The present sequence represents a primer used in an
CC example from the present invention

PT Newly isolated nucleic acid molecule (designated p23) encoding a p23
PT polypeptide - useful for inducing a senescence phenotype in a cell.
XX
PS Example 1; Page 18; 44pp; English.
XX
CC The present invention describes human senescence factor p23. An
CC expression vector for p23 is useful for inducing a senescent phenotype in
CC a cell (preferably eukaryotic). This may help in regulating diseases,
CC including cancer, persistent inflammation, and various proliferative and
CC degenerative disorders. These transgenic cells are useful in gene therapy
CC for treating cancer, particularly where antisense oligonucleotides are
CC useful for blocking normal or mutant p23 expression in cancer cells or
CC other proliferating cells. Transgenic cells are also useful for producing
CC the p23 polypeptide in large quantities. The antibodies are useful for
CC raising antiserum against p23, and for identifying senescent cells in
CC culture and tissue biopsies. The p23 polynucleotides are useful for
CC modulating or altering p23 activity in a cell, and for identifying and
CC isolating the whole gene encoding p23, and variants of p23. Assays based
CC on p23 elements, which detect p23 levels and activity are useful as
CC diagnostic markers for staging tumours, determining prognosis, and/or
CC predicting therapeutic success. These elements also provide an assay for
CC detecting chromosomal rearrangements in chromosome 3 in a human cell. The
CC isolation of the p23 polynucleotide permits the manipulation of malignant
CC growth in cancer. The present sequence represents a primer used in an

PT   New antisense oligonucleotides useful for treating e.g. pulmonary
PT   vasoconstruction, inflammation, allergies, asthma, hypertension,
PT   bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT   cancers.
XX
PS   Disclosure; Page 540; 1343pp; English.
XX
CC   The present invention describes a new composition comprising an antisense
CC   oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC   nucleic acids involved in bronchoconstriction, allergies, and/or
CC   inflammation. The ON can have antiinflammatory, antiallergic,
CC   antiasthmatic, cytostatic and analgesic activities. The compositions are
CC   useful for the treatment of diseases associated with inflammation,
CC   impaired airways, including lung disease and diseases whose secondary
CC   effects afflict the lungs of a subject. They can be used for treating
CC   e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC   impeded respiration, respiratory distress syndrome, pain, cystic
CC   fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC   pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC   carcinomas, and cancers which may metastasise to the lungs, including
CC   breast and prostate cancer. The reduction of the adenosine content of the
CC   ONs reduces side effects. The A-containing ONs break down with the
CC   release of deoxyadenosine which activates adenosine receptors causing
CC   bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC   nucleotide sequences given in the sequence listing from the present
CC   invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC   sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC   from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC   AAA33992) are specifically claimed ONs from the present invention. N.B.
CC   Sequences given in the disclosure of the present invention do not match
CC   up with their corresponding SEQ ID NO: sequences given in the sequence
CC   listing

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 264; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   New conformationally restricted 3',5'-bridged nucleosides and
PT   oligonucleotides useful as antisense therapeutics or as gene-specific
PT   diagnostics.
XX
PS   Example 20; Col 16; 10pp; English.
XX
CC   The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-
CC   C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in
CC   the sequence were incorporated by phosphoramidite chemistry using a DNA
CC   synthesiser. Bicyclic sugar nucleosides are conformationally restricted
CC   3',5'-bridged nucleosides which can be used as building blocks for
CC   oligonucleotides. Oligonucleotides can be produced that have certain,
CC   desired, geometrical shapes and entropy advantages. They may have
CC   superior hybridisation to DNA and RNA, and excellent biological
CC   stability. The conformationally-modified oligonucleotides may be useful
CC   as antisense inhibitors of gene expression or as gene probes, and may
CC   therefore be used in antisense therapeutics or gene-specific diagnostics

PT   Identifying pain-regulating compounds, useful for treating chronic pain
PT   and for diagnosis, by measuring binding of compounds to specific peptides
PT   and proteins.
XX
PS   Example 1; Page 62; 213pp; German.
XX
CC   The invention relates to identifying pain-regulating substances (A)
```

CC comprises (i) incubating a test substance with a cell (or preparation
CC from it) that has synthesised a peptide or protein (B) and (ii) measuring
CC either binding of the test substance to (B) or some functional parameter
CC that is altered by this binding. The method is useful for identifying
CC pain-regulating substances (A) with analgesic activity. (A) along with
CC nucleic acid (ABL88411-ABL88441) that encode proteins (B, ABB85006-
CC ABB85037) that interact with (A); (B); vectors containing the nucleic
CC acid; antibodies against (B); cells that express (B) and agents that bind
CC to (B), are all useful for treating pain, particularly chronic pain,
CC including use in gene therapy. The same materials can also be used for
CC diagnosis, e.g. of neurological and neurodegenerative diseases. The
CC present sequence is that of a PCR primer, used in examples of the
CC invention

PT Construction of cDNA tags for identifying expressed genes with specific
PT linkers and recognition sequences, applicable in gene expression
PT analysis, disease diagnosis and identifying target for gene therapy.
XX
PS Example 1; Page 24; 59pp; Japanese.
XX
CC The present invention describes a method for constructing a cDNA tag for
CC identifying an expressed gene. The method comprises: (a) preparation of
CC complementary deoxyribonucleic acid; (b) producing cDNA fragment by
CC cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA
CC fragment ligated material; (d) amplification of the linker X-cDNA tag-
CC linker Y ligated material; and (e) cleaving the amplification product.
CC The method can be used for the construction of cDNA tags for identifying
CC expressed genes, which is applicable in gene expression analysis, disease
CC diagnosis and identifying target for gene therapy, including the
CC clarification of difference in function or morphology of cells under
CC physiological or pathological conditions. The cDNA or cells for assay can
CC be specifically expressed, with reproducibility and accuracy in the
CC detection of genes. The present sequence represents an expressed gene
CC identification (EGI) cDNA tag related oligonucleotide which is used in an
CC example from the present invention

PT   Construction of cDNA tags for identifying expressed genes with specific
PT   linkers and recognition sequences, applicable in gene expression
PT   analysis, disease diagnosis and identifying target for gene therapy.
XX
PS   Example 1; Page 24; 59pp; Japanese.
XX
CC   The present invention describes a method for constructing a cDNA tag for
CC   identifying an expressed gene. The method comprises: (a) preparation of
CC   complementary deoxyribonucleic acid; (b) producing cDNA fragment by
CC   cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA
CC   fragment ligated material; (d) amplification of the linker X-cDNA tag-
CC   linker Y ligated material; and (e) cleaving the amplification product.
CC   The method can be used for the construction of cDNA tags for identifying
CC   expressed genes, which is applicable in gene expression analysis, disease
CC   diagnosis and identifying target for gene therapy, including the
CC   clarification of difference in function or morphology of cells under
CC   physiological or pathological conditions. The cDNA or cells for assay can
CC   be specifically expressed, with reproducibility and accuracy in the
CC   detection of genes. The present sequence represents an expressed gene
CC   identification (EGI) cDNA tag related oligonucleotide which is used in an
CC   example from the present invention

XX
CC   The present invention relates to retinoid (e.g., retinoic acid (RA),
CC   vitamin A) metabolising proteins and nucleic acid sequences encoding
CC   them. RA metabolising proteins contain a haeme-binding motif which is
CC   characteristic of the group of proteins known as cytochrome P450s. The
CC   sequences of the invention are useful in retinoid metabolism and in
CC   producing retinoic acid metabolising cytochrome P450s. They are
CC   particularly useful as targets for the treatment of certain cancers such
CC   as prostate cancer. The invention also relates to a method of screening
CC   drugs for their effect on activity of RA inducible proteins. The present
CC   DNA sequence is poly(T) PCR primer which is used for isolating retinoid
CC   regulating genes by differential display of mRNAs

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 11562; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 343; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT Ribozymes having modified bases and methods for producing them - for use
PT in inhibiting disease related genes.
XX
PS Claim 2; Page 175; 407pp; English.
XX
CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

XX
CC   The present sequence represents a preferred target sequence for an
CC   enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC   nucleotide base position indicated in the DE line. Regions of the mRNA
CC   that do not form secondary folding structures and that contain potential
CC   hammerhead and hairpin ribozyme cleavage sites were identified by
CC   computer analysis. Ribozymes directed against these mRNA sequences were
CC   designed and synthesised with modifications that improve their nuclease
CC   resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC   inhibit ICAM-1 expression, making them useful for reducing transplant
CC   rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC   asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC   correct PI field.)

```
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT   A new method useful for diagnosing human adenocarcinoma and measuring
PT   metastatic potential comprises determining the levels of macrophage
PT   migration inhibitory factor within tumor cells.
XX
PS   Claim 11; Col 7-8; 6pp; English.
XX
CC   This invention describes a novel method for diagnosing adenocarcinoma and
CC   determining metastatic ability of human cancer in an individual by
CC   determining the increased levels of macrophage migration inhibitory
CC   factor (MIF) within tumor cells. The method is useful for diagnosing
CC   human adenocarcinoma, as well as for its prognosis. The method is also
CC   useful for measuring levels of macrophage migration inhibitory factor
CC   within tumor cells. The method provides better and more accurate
CC   prognostic markers for cancer. The method is also capable of
CC   distinguishing histological tumors from clinical cancers. This sequence
CC   represents a primer used to detect the human MIF gene D5k region which is
CC   described in the method of the invention

PT   Removing unincorporated dye-labeled molecules associated with DNA
PT   sequencing, comprises using particles made of porous hydrophobic
PT   materials encapsulated in a hydrophilic matrix.
XX
PS   Example 1; Page 23; 57pp; English.
XX
CC   The present invention describes a method of removing unincorporated dye-
CC   labeled molecules from a mixture of the molecules and polymers. This is
CC   useful in the purification of primer extension products, for example in
CC   DNA sequencing and analysis. The present sequence was used to demonstrate
CC   the method of the invention

PT   Synthesizing branched nucleic acids useful as diagnostic and molecular
PT   probes, involves combining first units having haloalkylamino groups and
PT   second units having thiol or phosphorothioate groups.
XX
PS   Example 5; Col 17-18; 20pp; English.
XX
CC   The present invention relates to a method for synthesising a branched or
CC   multiply connected macromolecular structure, comprising oligonucleotide
CC   clamps (OC). The macromolecular structure is capable of specifically
CC   binding to a target molecule, and can therefore be used as probes. At
CC   least one OC comprises a target binding sequence that binds specifically
CC   and stably with the target molecule, and at least two OCs comprise signal
CC   generation moieties capable of generating a detectable signal in the
CC   presence of the target molecule. In addition the OCs are connected to one
CC   another by thioalkylamino, or thiophosphorylalkylamino bridges. The
CC   present sequence is an OC used in the present invention

PT   Removing unincorporated dye-labeled molecules from polymer incorporated
PT   with dye-labeled molecules, involves mixing and incubating the mixture
PT   with porous hydrophobic material entrapped within a hydrophilic matrix.
XX
PS   Example 1; Page 23; 58pp; English.
XX
CC   The present invention describes a method for removing unincorporated dye-
CC   labeled molecules from a mixture comprising dye-labeled molecules and a
CC   polymer into which dye-labeled molecules are incorporated, involving
CC   contacting the mixture with particles of a porous hydrophobic material
CC   entrapped within a hydrophilic matrix, incubating the mixture and
CC   removing the particles, thus removing the absorbed unincorporated dye-
CC   labeled molecules. This is useful for removing fluorescent and other dye-
CC   labeled molecules following procedures such as PCR

PT   Novel isolated endothelial estrogen regulated gene protein comprising
PT   lysyl oxidase activity and conserved catalytic domain of lysyl oxidase,
PT   useful as target to treat abdominal aortic aneurysms, myocardial
PT   infarction.
XX
PS   Example 1; Page 46; 68pp; English.
XX
CC   The patent discloses novel lysyl oxidase (LO) genes, termed endothelial
CC   estrogen regulated (EER)-7 genes and their corresponding proteins. The
CC   invention also relates to an assay system to identify compounds that
CC   selectively modulate EER7 protein activity by interaction with estrogen
CC   receptors. Stimulation of LO enzyme activity of EER-7 acts as a target
CC   for abdominal aortic aneurysms (AAA) and myocardial infractions. Increase
CC   in EER-7 lysyl oxidase activity increases elastin cross-linking in the
```

CC inner elastic lamina which prevents development of aneurysms. Increased
CC EER-7 is also useful to increase collagen cross-linkings which increase
CC tensile strength of vessel wall which also prevents aneurysms. Myocardial
CC infraction is prevented by inhibiting rupture of fibrous cap that covers
CC plaque in the coronary vessels. Increased tensile strength of the cap,
CC resulting from increased LO activity helps preventing the infractions.
CC Inhibition of LO activity is useful for treating fibrotic diseases.
CC Stimulation of EER-7 proteins are useful for treating patients with
CC estrogen-related disease states. Genetic variants of EER-7 can be
CC detected to diagnose an EER-7 associated disease such as AAA or
CC myocardial infarction. EER-7 polynucleotides are useful in gene therapy.
CC The present DNA sequence is an oligonucleotide which is used to identify
CC human EER-7 cDNA

PT A triple-helix comprising a double helical nucleic acid (DHNA) and an
PT oligonucleotide which binds in parallel and antiparallel orientation,
PT respectively, for targetting sequences on alternate strands of DHNA to
PT control gene expression.
XX
PS Example 6; Fig 20A; 108pp; English.
XX
CC The present invention relates to methods and oligonucleotides for forming
CC a triple-helix comprising a double helical nucleic acid comprising first
CC and second substantially complementary strands, and an oligonucleotide
CC bound to a purine-rich target sequence within the double helical nucleic
CC acid, where the oligonucleotide binds in a parallel and antiparallel
CC orientation, respectively, to target sequences on alternate strands of
CC the double helical nucleic acid. The method has therapeutic applications,
CC where gene expression is controlled by selective triple-helix formation
CC within expression regulatory sequences of a target gene. The
CC oligonucleotides can be used to form triple-helices, and are useful to
CC detect the presence or absence of specific sequences within genomic DNA
CC for diagnostic and therapeutic purposes. The oligonucleotides can be
CC selected to specifically bind to pathogenic double-stranded DNA including
CC specific sequences required by pathogenic bacteria or viruses for
CC replication or virulence, reducing their pathogenicity. Alternatively,
CC the oligonucleotide can be chosen to target a unique sequence of the
CC pathogen which is not found in the genome of pathogen's host. The
CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the
CC methods of the present invention

CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the
CC methods of the present invention

XX
CC The present invention relates to methods and oligonucleotides for forming
CC a triple-helix comprising a double helical nucleic acid comprising first
CC and second substantially complementary strands, and an oligonucleotide
CC bound to a purine-rich target sequence within the double helical nucleic
CC acid, where the oligonucleotide binds in a parallel and antiparallel
CC orientation, respectively, to target sequences on alternate strands of
CC the double helical nucleic acid. The method has therapeutic applications,
CC where gene expression is controlled by selective triple-helix formation
CC within expression regulatory sequences of a target gene. The
CC oligonucleotides can be used to form triple-helices, and are useful to
CC detect the presence or absence of specific sequences within genomic DNA
CC for diagnostic and therapeutic purposes. The oligonucleotides can be
CC selected to specifically bind to pathogenic double-stranded DNA including
CC specific sequences required by pathogenic bacteria or viruses for
CC replication or virulence, reducing their pathogenicity. Alternatively,
CC the oligonucleotide can be chosen to target a unique sequence of the
CC pathogen which is not found in the genome of pathogen's host. The
CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 747; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   2 samples, useful for disease diagnosis and gene analysis.
XX
PS   Example; Fig 1C; 19pp; English.
XX
CC   The invention relates to a method of sequential consensus region-directed
CC   amplification for sorting a mixture of DNAs into 2 or more subsets or
CC   distinguishing gene expression patterns in 2 samples. The methods, kits
CC   and oligonucleotides are useful for sorting a mixture of DNAs into 2 or
CC   more subsets or distinguishing gene expression patterns in 2 samples e.g.
CC   for disease diagnosis and gene analysis. The present sequence is oligo dT
CC   PCR primer used to illustrate the method of the invention

XX
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT   Regulating growth and structure of plants by modulating protein that
PT   controls cell division - specifically a D-type cyclin, and related
PT   chimeric genes and transformed cells and plants, used to alter growth
PT   rate, flowering, seed production etc.
XX
PS   Disclosure; Page 61; 75pp; English.
XX
CC   Primers AAV33891-V33904 were used to PCR amplify cDNA sequence encoding
CC   plant D-type cyclin (AAV33884-V33889). The cyclin sequences can be used
CC   to alter the growth characteristics or architecture of plants by altering
CC   the (functional) level in the plant cells of a cell-division controlling
CC   protein that can bind to, or phosphorylate, an Rb-like protein, such as a
CC   D-type cyclin. Modulation of the cyclin gene is used to increase or
CC   decrease the growth rate, provide faster germination, reduce time to
CC   flowering, increase the number of flowers, seeds or fruits per plant,
CC   increase root development, reduce height and to delay flowering in a
CC   range of plants, e.g. legumes, grasses, maize, oilseed rape, wheat,
CC   tomato, rice, barley, sunflower, carnation, chrysanthemum, rose, tulip,
CC   etc

PT   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT   stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT   rheumatoid arthritis, etc., in a human patient.
XX
PS   Claim 4; Page 89; 218pp; English.
XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention

PT   Novel ribozymes for modulating the synthesis, expression and/or stability
PT   of an mRNA encoding an angiogenic factors.
XX
PS   Claim 55; Page 147; 305pp; English.
XX
CC   The present invention describes enzymatic nucleic acid molecules with RNA
CC   cleaving activity, which specifically cleave RNA encoded by an aryl
CC   hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
CC   gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to
CC   AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,
CC   and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
CC   corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
CC   AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
CC   and AAA19155 to AAA19222 represent their corresponding target sequences;
CC   AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC   sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
CC   AAA21596 to AAA21688 represent their corresponding target sequences;
CC   AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
CC   for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
CC   AAA23422 represent their corresponding target sequences. The ribozymes of
CC   the invention are used for modulating the synthesis, expression and/or
CC   stability of an mRNA encoding angiogenic factor, especially ARNT,
CC   integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
CC   especially used to treat cancer, diabetic retinopathy, age related
CC   macular degeneration (ARMD), inflammation, and arthritis, as well as
CC   neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
CC   angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
CC   syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
CC   and other syndromes and diseases related to the levels of ARNT, Tie-2,
CC   integrin subunit alpha-6, or integrin subunit beta-3

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

PT   central nervous system injury.
XX
PS   Claim 30; Page 141; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is a hammerhead ribozyme of the invention

PT   New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic
PT   acids encoding the protein, useful for treating subjects having defects
PT   in KTOM1 which can manifest as cancer of the kidney, or as a disorder of
PT   e.g., liver or bone.
XX
PS   Example 2; Page 284; 418pp; English.
XX
```

CC The invention relates to a novel isolated nucleic acid encoding human
CC KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC invention has cytostatic activity. The nucleotide may have a use in gene
CC therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC monitor a disease caused by altered expression of human KTOM1.
CC Compositions comprising the nucleic acids, proteins or antibodies may be
CC used to treat subjects having defects in KTOM1 which can manifest as
CC cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC function. The sequence represents a probe used in the invention to scan
CC the nt 1-1001 portion of human KTOM1a (ABQ63232)

PT New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic
PT acids encoding the protein, useful for treating subjects having defects
PT in KTOM1 which can manifest as cancer of the kidney, or as a disorder of
PT e.g., liver or bone.
XX
PS Example 2; Page 284; 418pp; English.
XX
CC The invention relates to a novel isolated nucleic acid encoding human
CC KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC invention has cytostatic activity. The nucleotide may have a use in gene
CC therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC monitor a disease caused by altered expression of human KTOM1.
CC Compositions comprising the nucleic acids, proteins or antibodies may be
CC used to treat subjects having defects in KTOM1 which can manifest as
CC cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC function. The sequence represents a probe used in the invention to scan
CC the nt 1-1001 portion of human KTOM1a (ABQ63232)

PT New IKBKAP genes with mutations, useful for identifying a subject with
PT familial dysautonomia (FD), or for rapid carrier screening in the
PT Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or
PT prenatal diagnosis.
XX
PS Disclosure; Fig 11; 109pp; English.
XX
CC The present invention relates to methods and compositions useful for
CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day
CC syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM
CC 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565)
CC are associated with FD. The mutation associated with the major haplotype
CC of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine
CC nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced
CC with a cytosine. This results in skipping of exon 20 in the mRNA from FD
CC patients, although they continue to express varying levels of wild-type
CC message in a tissue-specific manner. The mutation associated with the
CC minor haplotype, FD2 mutation, is a bp mutation, where the guanine
CC nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.
CC This bp mutation causes an arginine to proline missense mutation (R696P)

```
CC   in the IKBKAP protein, which is predicted to disrupt a potential
CC   phosphorylation site. The IKBKAP nucleic acid sequences are useful for
CC   identifying a subject with FD and for rapid carrier screening. The IKBKAP
CC   gene maps to chromosome 9q31. A mouse model of FD was created in an
CC   example from the invention. Expression of murine Ikbkap was examined
CC   using both mouse embryo and adult mouse multiple tissue Northern blots.
CC   The blots were probes with a 1045bp PCR fragent that contains exons 2
CC   through 11, which was generated using PCR primers ABQ80563-ABQ80564.
CC   ABQ99662-ABQ99733 are the murine Ikbkap exon and intron boundaries

PT   New isolated nucleic acid encoding an isoform of human pregnancy
PT   associated plasma protein E, for preventing or aborting pregnancy.
XX
PS   Example 2; Page 302; 353pp; English.
XX
CC   This invention describes a novel isolated nucleic acid that encodes one
CC   of three new isoforms of human pregnancy associated plasma protein E,
CC   hPAPP-E. The products of the invention have abortive and contraceptive
CC   activity and can be used for gene therapy or in a vaccine. The nucleic
CC   acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC   used in pharmaceutical compositions or vaccines for preventing or
CC   aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC   dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC   the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC   antibodies can be used to assess the expression levels of PAPP-E isoform
CC   proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC   antenatally. This sequence represents an oligomer used in scanning the
CC   human PAPP-E genes described in the disclosure of the invention

CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HBV
CC   ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences

PT Novel compound useful for treating cirrhosis, liver failure,
PT hepatocellular carcinoma, or condition associated with hepatitis C virus
PT infection.
XX
PS Claim 1; Page 297; 387pp; English.
XX
CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNAzyme or minus strand DNAzyme sequences disclosed in the present
CC invention

XX
CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT Determining nucleotide sequence signature, by obtaining optical values
PT for each nucleotide position in a group, adjusting them to get ratio of
PT final highest values near predetermined factor, generating base call.
XX
PS Disclosure; Page 19; 73pp; English.
XX
CC The specification describes a method for determining a nucleotide
CC sequence signature. The method comprises obtaining optical measurements
CC with values indicating each nucleotide in a group of nucleotide
CC positions, adjusting the values until the ratio of highest value in the
CC set to next highest values in the set is at least a predetermined factor,
CC and generating a base call for a position in the group based on results
CC after the adjustment of values. The method is used for determining a
CC signature of a nucleotide sequence, and for determining a nucleotide
CC sequence of a polynucleotide from a series of optical measurements. The
CC present sequence represents an adaptor, which is used in the course of

PT   Preparation of antisense oligo:nucleotide(s) which lack long runs of
PT   consecutive guanosine or inosine - and have specific ratio of residues
PT   able to form two or three hydrogen bonds, have greater activity and
PT   reduced toxicity, used therapeutically or to modulate growth of cells in
PT   culture.
XX
PS   Example 2; Fig 4b; 286pp; English.
XX
CC   AAV48485-564 represent antisense oligonucleotides directed against the
CC   p53 gene. Of these, only oligonucleotides AAV48485-517 resulted in
CC   effective downregulation of negative growth by p53 and increased cell
CC   proliferation, while AAV48518-64 had little effect. The oligonucleotides
CC   exemplify the invention. The specification describes oligonucleotides
CC   that contain 8-30 nucleotides, which contain at most 8 nucleotides that
CC   can each form three hydrogen bonds to cytosine; do not contain four
CC   consecutive nucleotides able to form three H-bonds each to four
CC   consecutive cytosines; do not contain two sequences of three consecutive
CC   nucleotides each able to form three H-bonds to three consecutive
CC   cytosines, and the ratio between residues able to form two H-bonds each
CC   (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The
CC   oligonucleotides are used to modulate expression of genes, particularly
CC   the genes for p53, ErbB-2, junB, junD, TGF-beta 1 or beta 2 to control
CC   proliferation of primary cell cultures (e.g. bone marrow stem, liver or
CC   kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The
CC   oligonucleotides can also be used to analyse function of proteins (by
CC   altering their expression or activity) and therapeutically, e.g. in cases
CC   of cancer or (targeting TGF) for stimulating the immune system

CC can each form three hydrogen bonds to cytosine; do not contain four
CC consecutive nucleotides able to form three H-bonds each to four
CC consecutive cytosines; do not contain two sequences of three consecutive
CC nucleotides each able to form three H-bonds to three consecutive
CC cytosines, and the ratio between residues able to form two H-bonds each
CC (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The
CC oligonucleotides are used to modulate expression of genes, particularly
CC the genes for p53, ErbB-2, junB, junD, TGF-beta 1 or beta 2 to control
CC proliferation of primary cell cultures (e.g. bone marrow stem, liver or
CC kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The
CC oligonucleotides can also be used to analyse function of proteins (by
CC altering their expression or activity) and therapeutically, e.g. in cases
CC of cancer or (targeting TGF) for stimulating the immune system

XX
CC AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC invention, which contain a polymorphic base at position 24 of their
CC nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC primers for the biallelic markers. The biallelic markers of the invention
CC have a variety of uses: they can be used for high density mapping of the
CC human genome, and in complex association studies and haplotyping studies
CC which are useful in determining the genetic basis for disease states.
CC Compositions and methods of the invention can also be useful for the
CC identification of the targets for the development of pharmaceutical
CC agents and diagnostic methods, as well as the characterisation of the
CC differential efficacious responses to and side effects from
CC pharmaceutical agents acting on a disease as well as other treatment.

PT stearoyl-CoA desaturase gene.
XX
PS Example 3; SEQ ID NO 119; 139pp; English.
XX
CC The present invention describes a short interfering nucleic acid (siNA)
CC that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC by RNA interference. Also described: (1) modulating expression of SCD
CC genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC virucide activities. The siNAs can be used to modulate expression of SCD
CC genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC diabetes (types I and II); atherosclerosis; cancer and viral infections.
CC They can also be used for drug screening; diagnosis; target
CC identification and validation; genetic engineering; pharmacogenomics;
CC studying gene function and gene mapping (e.g. of single-nucleotide
CC polymorphisms). The present sequence represents an SCD siNA, which is
CC used in the exemplification of the present invention.

PS Disclosure; Page 14; 46pp; English.
XX
CC This sequence represents a PCR primer used in the sequencing of the exon
CC 1A region of human phenol sulphotransferase 2 (STP2). The invention
CC relates to sequences AAZ59305-Z59352 which are fragments of the STP2
CC gene. The fragments are from the 8 exons, the promoter region, 3' and 5'
CC untranslated regions of the STP2 gene. Each of the sequences contains a
CC newly identified STP2 gene single nucleotide polymorphism (SNP). STP2 is
CC a phenol sulphotransferase. Substrates for STP2 include minoxidil,
CC acetaminophen, and paranitrophenol. Several of the nucleotide changes
CC identified at the polymorphism sites, give rise to an amino acid change.
CC Amino acid changes may result in altered enzyme activity. The sequences
CC can be used as probes for detecting STP2 polymorphisms. The polymorphic
CC probes are used in screening and genotyping, i.e. to predict the rate of
CC metabolism of STP2 substrates, potential drug-drug interactions and
CC adverse side effects. They can also be used to detect diseases resulting
CC from accidental or occupational exposure to toxins and to establish
CC animal, cell or in vitro models for drug metabolism

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 337; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the

PT Vaccinating against tumors, infectious diseases, allergies and asthma
PT using immunostimulatory Py-rich and TG nucleic acids.
XX
PS Claim 101; Page 46; 338pp; English.
XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT   New antisense compound to inhibit caspase 3 is useful for treating
PT   hepatitis and atherosclerosis.
XX
PS   Example 17; Page 87; 127pp; English.
XX
CC   The present sequence for human caspase 3 antisense oligonucleotide 108954
CC   is 1 of various novel antisense oligonucleotides (AAS10517-AAS10676)
CC   described in the present invention. Also described are methods of using
CC   these compounds for the modulation of caspase 3 expression. The caspase 3
CC   antisense oligonucleotides specifically hybridise with and inhibit the
CC   expression of caspase 3. Antisense compounds targeted to caspase 3 are
CC   useful to inhibit caspase 3 expression in cells or tissues and to
CC   modulate apoptosis. The caspase 3 antisense oligonucleotides are useful
CC   for treating disorders associated with expression of caspase 3. Such
CC   disorders include hyperproliferative disorders (e.g. cancer), viral
CC   infections (e.g. hepatitis), haematopoietic disorders, autoimmune
CC   disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's
CC   disease)

PT New antisense compounds capable of modulating expression of human protein
PT phosphatase 1B, useful for diagnosis, prophylaxis and treatment of
PT diseases associated with expression of protein phosphatase.
XX
PS Claim 1; Col 42; 71pp; English.
XX
CC The invention is directed to antisense compounds, particularly
CC oligonucleotides which are targetted to a DNA encoding protein
CC phosphatase 1B (PTP1B) to modulate its expression. The antisense
CC compounds are useful for diagnosis, prophylaxis and treatment of diseases
CC associated with the expression of PTP1B, to prevent or delay infection,
CC inflammation and tumour formation and as a research reagent. The PTP1B
CC DNA is useful in gene therapy. The present sequence is an antisense
CC oligonucleotide with a phosphorothioate backbone. This oligo is targetted
CC to human PTP1B to inhibit its expression

PT Compound for inhibiting the expression of protein phosphatase 1B (PTP1B)
PT and for treating diabetes, cancer, or obesity, comprises an antisense
PT oligonucleotide targeted to nucleic acid encoding PTP1B.
XX
PS Claim 3; Page 23; 133pp; English.
XX
CC The invention relates to a compound of 8-50 nucleobases in length
CC targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
CC the compound specifically hybridises with and inhibits the expression of
CC PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
CC compound of 8-50 nucleobases in length which specifically hybridises with
CC an 8 nucleobase portion of an active site on a nucleic acid encoding
CC PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues
CC comprising contacting the cells or tissues with the compound; treating an
CC animal having or suspected of having a disease or condition associated
CC with PTP1B comprising administering the compound; (4) decreasing blood
CC sugar levels in an animal comprising administering the compound; (5)
CC preventing or delaying the onset of a disease or condition associated
CC with PTP1B in an animal comprising administering the compound; and (6)
CC preventing or delaying the onset of an increase in blood glucose levels
CC in an animal comprising administering the compound. The compound is used
CC to inhibit the expression of PTP1B in cells or tissues, to treat or
CC prevent or delay the onset of a disease or condition associated with
CC PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian
CC cancer, chronic myeloid leukaemia and hyperproliferative diseases in an
CC animal having or suspected of having the disease or condition, and for
CC decreasing blood sugar levels or preventing or delaying the onset of an
CC increase in blood glucose levels in an animal. The compound is also used
CC in diagnostics, therapeutics, prophylaxis, and in research reagents and
CC kits. The present sequence is an antisense compound of the invention
CC targetting human PTP1B

PT Novel antisense compound useful for treating type 2 diabetes, cancer and
PT obesity, is targeted to nucleic acid encoding human protein phosphatase
PT 1B, and hybridizes and inhibits PTP1B expression.
XX
PS Claim 3; Page 67; 142pp; English.
XX
CC The invention relates to a compound targeted to a nucleic acid molecule
CC encoding protein phosphatase 1B (PTP1B), which specifically hybridises
CC with and inhibits the expression of PTP1B. The compounds of the invention
CC are useful for inhibiting the expression of PTP1B in liver, kidney or
CC adipose cells or tissues and for treating an animal, preferably human,
CC having a disease or condition associated with PTP1B, including metabolic
CC diseases or conditions, e.g. type 2 diabetes and obesity, or
CC hyperproliferative conditions such as cancer. The sequences are also
CC useful for decreasing blood (serum or plasma) glucose levels in an animal
CC e.g. a diabetic human or rodent, for preventing or delaying the onset of
CC a disease or condition associated with PTP1B , and for preventing or
CC delaying the onset of an increase in blood glucose levels. This sequence
CC represents a PTP1B mRNA level inhibition antisense oligonucleotide of the
CC invention

PT Designing capture oligonucleotide probes for use on a support to which
PT complementary oligonucleotides hybridize with little mismatch.
XX
PS Example 5; Fig 29; 300pp; English.
XX
CC The present invention describes a method (M1) for designing capture
CC oligonucleotide probes (I) for use on a support to which complementary
CC oligonucleotide probes (II) will hybridise with little mismatch, where
CC (I) have melting temperatures within a narrow range. The method is useful
CC for detecting infectious diseases caused by bacterial infectious agents
CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC Epstein-Barr virus and polio virus, and parasitic infectious agents
CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus
CC medinesis. The method is also useful for detecting genetic diseases such
CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC involved in DNA amplification, replication, recombination or repair, the
CC cancer is specifically associated with a gene selected from BRCA1 gene,
CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
CC method is also used for environmental monitoring, forensics and the food
CC and feed industry, detecting comprises scanning (using e.g. a scanning
CC electron microscope and infrared microscope) the support at the
CC particular sites and identifying if ligation of the oligonucleotide probe
CC sets occurred and correlating (using a computer) identified ligation to a
CC presence or absence of the target nucleotide sequences. ABI82074 to
CC ABI97546 represent oligonucleotide sequences used in the exemplification
CC of the present invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its

PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4731; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its

PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 6131; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

CC   The present invention provides a method of diagnosing a vascular disease
CC   in an individual, involving determining the sequence at various
CC   polymorphic sites within the human thrombospondin 1 and thrombospondin 4
CC   genes. The sequences at a number of polymorphic sites are also provided
CC   in the specification. In particular, the method can be used in the
CC   diagnosis of atherosclerosis, myocardial infarction, coronary heart
CC   disease, stroke, peripheral vascular diseases, venous thromboembolism and
CC   pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
CC   useful in forensics, paternity testing, genetic analysis and phenotype
CC   correlations to diseases. The present sequence is an example of one of
CC   the human gene SNPS shown in the specification

PT   Differentially expressed genes involved in angiogenesis, useful for
PT   treating e.g. vascular tumors, atherosclerosis and/or restenosis
PT   subsequent to balloon angioplasty.
XX
PS   Example 19; Page 148; 182pp; English.
XX
CC   The present invention describes differentially expressed genes involved
CC   in angiogenesis (I), and the polypeptides that encode them. (I) have
CC   cardiovascular activity, and can be used in the modulation of
CC   angiogenesis. The nucleic acids and polypeptides may be used in the
CC   prevention, diagnosis and treatment of diseases associated with
CC   inappropriate angiogenesis. The polypeptides may also be used as antigens
CC   in the production of antibodies against them and in assays to identify
CC   modulators of their expression and activity. The antibodies and
CC   antagonists may also be used to down regulate expression and activity and
CC   modulate angiogenesis. The antibodies may also be used as diagnostic
CC   agents for detecting the presence of the polypeptides in samples.
CC   Disorders that may be prevented, diagnosed and/or treated by the above
CC   methods include, for example vascular tumours, proliferative tumours,
CC   proliferative vitreoretinopathy, rheumatoid arthritis, Crohn's disease,
CC   atherosclerosis, ovarian hyperstimulation, psoriasis, endometriosis
CC   associated with neovascularisation, restenosis subsequent to balloon
CC   angioplasty, scar tissue over production. peripheral vascular disease,
CC   hypertension, inflammatory vasculitides, Reynaud's disease and Reynaud's
CC   phenomenon, aneurysms, arterial restenosis, thrombophlebitis,
CC   lymphangitis, lymphedema, wound healing and tissue repair, ischaemia
CC   reperfusion injury, angina, myocardial infarctions, chronic heart
CC   conditions, heart failure such as congestive heart failure, age-related
CC   macular degeneration and osteoporosis. AAH22255 to AAH22325 and AAB98322

PT Polypeptide-human macroprotein 11.88 and polynucleotide for coding it.
XX
PS Example 2; Page 19 (Disclosure); 34pp; Chinese.
XX
CC The present invention describes human macroprotein 11.88 (I). Also
CC described is a process for preparing (I) using DNA recombination
CC techniques. (I) and the polynucleotide encoding it can be used in the
CC treatment of diseases such as embryo development disorders and tumours.
CC The present sequence represents a PCR primer for human macroprotein
CC 11.88, which is used in an example from the present invention

PT Identifying extendible primers for use in identification, or
PT classification of a nucleic acid of an organism, allele or gene such as
PT class 1/2 HLA comprises identifying all possible nucleotide sequences of
PT specific length.
XX
PS Claim 14; Page 43; 66pp; English.
XX
CC The present invention provides a method for identifying a set of
CC extendible primers which can be used in the identification, typing and
CC classification of genes. This can then be used to predict protein
CC sequence and structure, in organ donation to match the organ with the
CC receiver, and to identify bacteria in a sample. The method can be used to
CC type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC particular

PT   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT   stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT   rheumatoid arthritis, etc., in a human patient.
XX
PS   Claim 4; Page 79; 218pp; English.
XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

CC   The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is
CC   one of four oligonucleotides which were designed to specifically bind and
CC   cross-link to the duplex target sequence AAQ20004. Oligo #2 has the
CC   covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 3' end. An
CC   assay for crosslinked triple helix showed considerable reaction with
CC   Oligo #2 and with Oligo #1 (see AAQ20005) which has the crosslinking
CC   group at the 5' end. The most complete reaction was seen with Oligo #3
CC   (see AAQ20007) having N4N4-ethanocytosine at both the 5' and 3' termini.
CC   A control oligo with no cross-linking group showed no reaction. The half-
CC   life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microM);
CC   Oligo #1 showed a rate four times slower. See also AAQ20008

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
```

```
XX
PS   Claim 11; Page 64; 77pp; English.
XX
CC   The sequence depicts a HUMIL2 (interleukin-2) sequence beginning at
CC   nucleotide 1114. The sequence is a viral duplex sequence contg. a purine-
CC   rich region concentrated on one chain of the duplex. The sequence may be
CC   prepd. by standard DNA synthesis. The HUMIL2 duplex sequence is used as a
CC   target for novel oligomers which are capable of forming a triplex at
CC   physiological pH by coupling into the major groove of the DNA duplex. Six
CC   such oligomers IL2 401-6 are capable of forming a triplex with this
CC   sequence. The oligomers are used in the treatment of inflammation.
CC   Similar oligomers may be used to target viral DNA duplexes specific for
CC   HIV, herpes and other viruses. The triple helices form under mild
CC   conditions thus assays may be carried out without subjecting the test
CC   specimen to harsh conditions. The oligomer is able to inhibit gene
CC   expression, as verified by in vitro systems. See also AAQ25452-25501 and
CC   AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT   Prodn. of gene prods. in a patient's liver - by transducing hepatocyte(s)
PT   with adenoviral vectors expressing molecules which induce hepatocyte
PT   regeneration, e.g. tPA, useful for e.g. for treatment of hepatitis C.
XX
PS   Claim 24; Page 56; 74pp; English.
XX
CC   A gene product can be produced in a patient's liver by transducing
CC   hepatocytes in situ with an adenoviral vector (AV) encoding the gene
CC   product desired and which also comprises a sequence encoding tissue
CC   plasminogen activator (tPA) or urokinase plasminogen activator (uPA)
CC   which promote rapid liver regeneration. The method is particularly useful
CC   for the treatment of hepatitis C virus since the AV can be made to encode
CC   one or more ribozymes specific for HCV RNA. HCV ribozyme target sequences
CC   are described in AAT32741-46. This target sequence corresponds to
CC   nucleotides 385-401 of HCV RNA

PT   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT   stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT   rheumatoid arthritis, etc., in a human patient.
XX
PS   Claim 4; Page 114; 218pp; English.
XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention
